E,HExplanation: This is an example of privilege escalation. Privilege escalation is the act of exploiting a bug, design flaw or configuration oversight in an operating system or software application to gain elevated access to resources that are normally protected from an application or user. The question states that the web server communicates with the database server via an account with SELECT only privileges. However, the privileges listed include read, write and execute (rwx). This suggests the privileges have been 'escalated'. Now that we know the system has been attacked, we should investigate what was done to the system. The command "Update crontab with: `find / (-perm -4000) type f print0 | xargs -0 ls -l | email.sh`" is used to find all the files that are setuid enabled. Setuid means set user ID upon execution. If the

setuid bit is turned on for a file, the user executing that executable file gets the permissions of the individual or group that owns the file.
