NEW QUESTION: 2A. Option DB. Option AC. Option CD. Option B**Answer: D****Explanation:**When a zone that this DNS server hosts is a stub zone, this DNS server is a source only for information about the authoritative name servers for this zone. The zone at this server must be obtained from another DNS server that hosts the zone. This DNS server must have network access to the remote DNS server to copy the authoritative name server information about the zone. A stub zone will forward and refer requests only for the key resource records that identify the authoritative servers for the zone. Thus a stub zone can be used to prevent Server1 to try and resolve Internet host names. Stub zones are used to improve name resolution so that the DNS server will perform recursion using the stub zone's list of name server without querying the Internet or even an internal root server.
