NEW QUESTION: 1You develop an HTML application that is located at www.adventure-works.com.The application must load JSON data from www.fabrikam.com. You need to choose an approach for loading the data.What should you do?**A.** Use the jQuery getJSON method.**B.** Configure Cross-Origin Resource Sharing (CORS) on the servers.**C.** Load the data by using WebSockets.**D.** Design a REST URI scheme with multiple domains.**Answer: B**
Explanation:* Cross-origin resource sharing (CORS) is a mechanism that allows Javascript on a web page to make XMLHttpRequests to another domain, not the domain the Javascript originated from. Such "cross- domain" requests would otherwise be forbidden by web browsers, per the same origin security policy.CORS defines a way in which the browser and the server can interact to determine whether or not to allow the cross-origin request.[2] It is more powerful than only allowing same-origin requests, but it is more secure than simply allowing all such cross-origin requests.* You must use Cross Origin Resource SharingIt's not as complicated as it sounds...simply set your request headers appropriately...in Python it would look like:

```
self.response.headers.add_header('Access-Control-Allow-Origin', '*');  
self.response.headers.add_header('Access-Control-Allow-Methods', 'GET, POST, OPTIONS');  
self.response.headers.add_header('Access-Control-Allow-Headers', 'X-Requested-With');  
self.response.headers.add_header('Access-Control-Max-Age', '86400');
```
