NEW QUESTION: 3

ミッションクリティカルなアプリケーションを実行する仮想マシン (VM) があります。VMがダウンタイムを経験しないようにする必要があります。

何をお勧めしますか？答えるには、適切なソリューションを正しいシナリオにドラッグします。各ソリューションは、1回、複数回使用することも、まったく使用しないこともできます。コンテンツを表示するには、ペイン間で分割バーをドラッグするか、スクロールする必要がある場合があります。注：それぞれの正しい選択には1ポイントの価値があります。**Answer: Explanation:**

Explanation:Box 1: Scale setA virtual machine scale set allows you to deploy and manage a set of identical, autoscaling virtual machines.Box 2: Availability SetAn Availability Set is a logical

grouping capability for isolating VM resources from each other when they're deployed. Azure makes sure that the VMs you place within an Availability Set run across multiple physical servers, compute racks, storage units, and network switches. If a hardware or software failure happens, only a subset of your VMs are impacted and your overall solution stays operational. Availability Sets are essential for building reliable cloud solutions. **Box 3: Fault domain** A fault domain is a logical group of underlying hardware that share a common power source and network switch, similar to a rack within an on-premises datacenter. As you create VMs within an availability set, the Azure platform automatically distributes your VMs across these fault domains. This approach limits the impact of potential physical hardware failures, network outages, or power interruptions. **Incorrect Answers:** An update domain is a group of VMs and underlying physical hardware that can be rebooted at the same time. **References:**

NEW QUESTION: 4 Which timer expiration can lead to an EIGRP route becoming stuck in active?

A. active **B. hello** **C. hold** **D. query** **Answer: A** **Explanation:** Explanation/Reference: Explanation: As noted above, when a route goes into the active state, the router queries its neighbors to find a path to the pertinent network. At this point, the router starts a three minute active timer by which time it must receive replies from all queried neighbors. If a neighbor has feasible successors for the route, it will recalculate its own local distance to the network and report this back. However, if a neighbor does not have a feasible successor, it also goes into active state. In some cases, multiple routers along multiple query paths will go into active state as routers continue to query for the desired route. In most cases, this process will yield responses from all queried routers and the sought after route will transition back into the passive state within the three minute SIA query timer. In the case that none of the queried routers can provide a feasible successor, the route is cleared. In some cases, a response is not received between two neighbor routers because of link failures, congestion or some other adverse condition in either the network or on the queried router, and the three minute active timer expires on the router originating the query. When this happens, the querying router that did not receive a response logs a "DUAL-3-SIA" or "stuck-in-active" error for the route and then drops and restarts its adjacency with the non-responding router **Reference:**
