**A. Bandwidth B. Reliability C. Delay D. MTU E. Load**  
**Answer: A,C**  
Explanation: EIGRP adds together weighted values of different network link characteristics in order to calculate a metric for evaluating path selection. These characteristics include: Delay (measured in 10s of microseconds) Bandwidth (measured in kilobytes per second) Reliability (in numbers ranging from 1 to 255; 255 being the most reliable) Load (in numbers ranging from 1 to 255; 255 being saturated) Various constants (K 1 through K 5) are able to be set by a user to produce varying routing behaviors. However by default, only delay and bandwidth are used in the weighted formula to produce a single 32bit metric: Note: Default K values are: K1 = K3 = 1 and K2 = K4 = K5 = 0 When K5 is equal to 0 then  $[K5 / (K4 + reliability)]$  is defined to be 1 Use of the default constants effectively reduces the formula above to: Reference:
