The contents of HPE0-J68 exam torrent are compiled by our experts through several times of verification and confirmation, The finicky points can be solved effectively by using our HPE0-J68 practice materials.

You just need to spend 48 to 72 hours on studying, and you can pass the exam, We offer you the HPE0-J68 exam dumps to help you pass the exam.

NEW QUESTION: 1HOTSPOT**Answer:** Explanation:

NEW QUESTION: 2어떤 서비스가 AWS 클라우드를 포함하는 하이브리드 아키텍처에서 네트워크 연결을 제공합니까?**A.** AWS Direct Connect**B.** Amazon VPCC. AWS 디렉토리 서비스**D.** Amazon API 게이트웨이

Answer: BExplanation:ExplanationAmazon Virtual Private Cloud (Amazon VPC) is a logically isolated, private section of the AWS Cloud to launch resources in a virtual data center in the cloud. Amazon VPC allows you to leverage multiple Availability Zones (AZ) within a region so that you can build greater fault tolerance within your workloads.You have complete control. Reference:

<https://aws.amazon.com/blogs/publicsector/aws-networking-capabilities-gives-you-choices-for-hybrid-cloud-con>

NEW QUESTION: 3You execute the following command to set the redundancy retention policy in Recovery Manager (RMAN):RMAN> CONFIGURE RETENTION POLICY TO REDUNDANCY 3; Identify the statement that correctly describes the implications of this command.**A.** When there are already three backups, for the fourth backup RMAN marks the oldest backup as obsolete.**B.** when there are already three backup, one of the existing backups must be removed manually before takingthe fourth backup.**C.** the number of backups that are retained is equal to three and it includes full, incremental, and cumulativebackups.**D.** when there are already three backups, for the fourth backup RMAN removes the oldest backup.**Answer: A**Explanation: Explanation/Reference:Explanation:Configuring a Redundancy-Based Retention PolicyThe REDUNDANCY parameter of the CONFIGURE RETENTION POLICY command specifies how many full or level 0 backups of each data file and control file that RMAN should keep. If the number of full or level0backups for a specific data file or control file exceeds the REDUNDANCY setting, then RMAN considers the extra backups as obsolete. The default retention policy is REDUNDANCY 1.As you produce more backups, RMAN keeps track of which ones to retain and which are obsolete. RMAN retains all archived logs and incremental backups that are needed to recover the non obsolete backups.Assume that you make a full backup of data file 7 on Monday, Tuesday, Wednesday, and Thursday. You now have four full backups of this data file. If REDUNDANCY is 2, then the Monday and Tuesday backups are obsolete. If you make another backup on Friday, then the Wednesday backup of data file 7 becomes obsolete. Assume a different case in which REDUNDANCY is 1. You run a level 0 database backup at noon on Monday, a level 1 cumulative backup at noon on Tuesday and Wednesday, and a level 0 backup at noon on Thursday. Immediately after each daily backup you run the command DELETE OBSOLETE.The Wednesday DELETE command does not remove the Tuesday level 1 backup because this backup is not redundant: the Tuesday level 1 backup could be used to recover the Monday level 0 backup to a time between noon on Tuesday and noon on Wednesday. However, the DELETE command on Thursday removes the previous level 0 and level 1backups.Run the

CONFIGURE RETENTION POLICY command at the RMAN prompt, as in the following example:
CONFIGURE RETENTION POLICY TO REDUNDANCY 3;
