Implement calendar sharing to partner companies.
Implement a solution that prevents malware from being delivered to end users.
Use personal archives to eliminate the need for PST files.
Ensure the Brussels office and move all the users in the Brussels office to the main office. All the mailboxes in the Brussels office will be moved to a server in the main office.
Implement a compliance solution to ensure that items deleted from public folders are retained. If an item in a public folder is modified, the original version of the item must be available.

NEW QUESTION: 2 Sie entwickeln eine Softwarelösung für ein autonomes Verkehrssystem. Die Lösung verwendet große Datensätze und die Azure-Stapelverarbeitung, um Navigationsätze für ganze Fahrzeugflotten zu simulieren. Sie müssen Rechenknoten für die Lösung in Azure Batch erstellen. Was tun?
A. Implementieren Sie in Python die Klasse TaskAddParameter
B. Erstellen Sie im Azure-Portal ein Stapelkonto
C. Rufen Sie in einer .NET-Methode die Methode BatchClient.PoolOperations.CreateJob auf
D. Implementieren Sie in Python die Klasse: JobAddParameter
Answer: C
Explanation: A Batch job is a logical grouping of one or more tasks. A job includes settings common to the tasks, such as priority and the pool to run tasks on. The app uses the BatchClient.JobOperations.CreateJob method to create a job on your pool.
Note: Step 1: Create a pool of compute nodes. When you create a pool, you specify the number of compute nodes for the pool, their size, and the operating system. When each task in your job runs, it's assigned to execute on one of the nodes in your pool.
Step 2: Create a job. A job manages a collection of tasks. You associate each job to a specific pool where that job's tasks will run.
Step 3: Add tasks to the job. Each task runs the application or script that you uploaded to process the data files it downloads from your Storage account. As each task completes, it can upload its output to Azure Storage.
Incorrect Answers: C: To create a Batch pool in Python, the app uses the PoolAddParameter class to set the number of nodes, VM size, and a pool configuration.

Answer: D

NEW QUESTION: 4 Which of the following are valid justifications for developers testing their own code during unit testing?
(i) Their lack of independence is mitigated by independent testing during system and acceptance testing.
(ii) A person with a good understanding of the code can find more defects more quickly using white-box techniques.
(iii) Developers have a better understanding of the requirements than testers.
(iv) Testers write unnecessary incident reports because they find minor differences between the way in which the system behaves and the way

in which it is specified to work.**A.** (ii) and (iii)**B.** (i) and (ii)**C.** (i) and (iv)**D.** (iii) and (iv)**Answer: B**
Explanation:Explanation/Reference:Explanation:It is unlikely that developers will have a better understanding of the requirements than testers, partly because testers work closely with the user community (and may be drawn from it) and partly because developers seldom work with the complete set of requirements in a medium to large development. Testers may raise incidents related to the difference between user expectations and the specification, but these are not unnecessary. Such issues are more likely to arise at the later stages of testing. Early testing (unit testing) is usually done most effectively by developers with a good understanding of the code and the development environment; they can be more efficient and more effective at this level. Later independent stages of testing offset any disadvantage from the lack of independence at unit testing level.
