**NEW QUESTION: 1** Consider the topology: Application on a Windows machine <-- {SSL VPN} --> FG --> Telnet to Linux server. An administrator is investigating a problem where an application establishes a Telnet session to a Linux server over the SSL VPN through FortiGate and the idle session times out after about 90 minutes. The administrator would like to increase or disable this timeout. The administrator has already verified that the issue is not caused by the application or Linux server. What two changes can the administrator make to resolve the issue without affecting services running through FortiGate? (Choose two.) **A.** Create a new service object for TELNET and set the maximum session TTL. **B.** Set the maximum session TTL value for the TELNET service object. **C.** Create a new firewall policy and place it above the existing SSLVPN policy for the SSL VPN traffic, and set the new TELNET service object in the policy. **D.** Set the session TTL on the SSLVPN policy to maximum, so the idle session timeout will not happen after 90 minutes. **Answer: B,D**

Amazon RDS Read Replicas Enhanced performance You can reduce the load on your source DB instance by routing read queries from your applications to the read replica. Read replicas allow you to elastically scale out beyond the capacity constraints of a single DB instance for read-heavy database workloads. Because read replicas can be promoted to master status, they are useful as part of a sharding implementation. To further maximize read performance, Amazon RDS for MySQL allows you to add table indexes directly to Read Replicas, without those indexes being present on the master.
