NEW QUESTION: 2 Which of the following transportation encryption protocols should be used to ensure maximum security between a web browser and a web server? **A.** RSAB **B.** SSHv1 **C.** TLS **D.** SSLv2 **Answer: C**
Explanation: HTTP Secure (HTTPS) is the protocol used for "secure" web pages that users should see when they must enter personal information such as credit card numbers, passwords, and other identifiers. It combines HTTP with SSL/TLS to provide encrypted communication. Transport Layer Security (TLS) is a security protocol that expands upon SSL. Many industry analysts predict that TLS will replace SSL, and it is also referred to as SSL 3.1.

NEW QUESTION: 3 CEFとプロセススイッチングの違いは何ですか。 **A.** プロセスの切り替えはCEFよりも高速です。 **B.** CEFはFIBと隣接テーブルを使用して転送の決定を行いますが、プロセススイッチングは各パケットをパントします。 **C.** CEFはプロセススイッチングよりもCPUに負荷がかかります。 **D.** CEFは、プロセススイッチングで管理するには複雑すぎるパケットを処理します。 **Answer: B**
Explanation: Punt is often used to describe the action of moving a packet from the fast path (CEF) to the route processor for handling. Cisco Express Forwarding (CEF) provides the ability to switch packets through a device in a very quick and efficient way while also keeping the load on the router's processor low. CEF is made up of two different main components: the Forwarding Information Base Adjacency Table. Process switching is the slowest switching methods (compared to fast switching and Cisco Express Forwarding) because it must find a destination in the routing table. Process switching must also construct a new Layer 2 frame header for every packet. With process switching, when a packet comes in, the scheduler calls a process that examines the routing table, determines which interface the packet should be switched to and then switches the packet. The problem is, this happens for the every packet. Reference: <http://www.cisco.com/web/about/security/intelligence/acl-logging.html>
