NEW QUESTION: 1You have an on-premises network that contains a Hyper-V host named Host1. Host1 runs Windows Server 2016 and hosts 10 virtual machines that run Windows Server 2016. You plan to replicate the virtual machines to Azure by using Azure Site Recovery. You create a Recovery Services vault named ASR1 and a Hyper-V site named Site1. You need to add Host1 to ASR1. What should you do?
A. Download the installation file for the Azure Site Recovery Provider. Download the vault registration key. Install the Azure Site Recovery Provider on each virtual machine and register the virtual machines.
B. Download the installation file for the Azure Site Recovery Provider. Download the storage account key. Install the Azure Site Recovery Provider on Host1 and register the server.
C. Download the installation file for the Azure Site Recovery Provider. Download the vault registration key. Install the Azure Site Recovery Provider on Host1 and register the server.
D. Download the installation file for the Azure Site Recovery Provider. Download the storage account key. Install the Azure Site Recovery Provider on each virtual machine and register the virtual machines.
Answer: C
Explanation: Below are the steps you need to perform in this scenario. Refer the link mentioned in the reference section.
Download the installation file for the Azure Site Recovery Provider
To set up the source environment, you create a Hyper-V site and add to that site the Hyper-V hosts containing VMs that you want to replicate. Then, you download and install the Azure Site Recovery Provider and the Azure Recovery Services agent on each host, and register the Hyper-V site in the vault.
Download the vault registration key
Download the Vault registration key. You need this when you install the Provider. The key is valid for five days after you generate it.
Install the Azure Site Recovery Provider on Host1.
Install the downloaded setup file (AzureSiteRecoveryProvider.exe) on each Hyper-V host that you want to add to the Hyper-V site. Setup installs the Azure Site Recovery Provider and Recovery Services agent on each Hyper-V host.
Register the server
In Registration, after the server is registered in the vault, select Finish.

NEW QUESTION: 2A. Option A B. Option D C. Option B D. Option C **Answer: A,D**

NEW QUESTION: 3You have a Hyper-V host named Server1 that runs Windows Server 2016. Server1 has two network adaptors named NK1 and NIC2. Server2 has two virtual switches

named vSwitch1 and vSwitch2. NIC1 connects to vSwitch1. NIC2 connects to vSwitch2 Server1 hosts a virtual machine named VM1. VM1 has two network adapters named vmNIC1 and vmNIC2. vmNIC1 connects to vSwitch1. vmNIC2 connects to vSwitch2. You need to create a NIC team on VM1. What should you run on VM1? To answer, select the appropriate options in the answer area. NOTE: Each correct selection is worth one point. **Answer:** Explanation: Explanation \$var1 = "SwitchIndependent" \$var2 = "TransportPorts" Explanation/Reference: <https://docs.microsoft.com/en-us/windows-server/networking/technologies/nic-teaming/create-a-new-nic-team> Network configuration requirements The physical switch, Hyper-V Virtual Switch, local area network (LAN), and NIC Teaming requirements for creating a NIC Team in a VM are: The computer that is running Hyper-V must have two or more network adapters. If the network adapters are connected to multiple physical switches, the physical switches must be on the same Layer 2 subnet. You must use Hyper-V Manager or Windows PowerShell commands to create two external Hyper-V Virtual Switches, each of which is connected to a different physical network adapter. The VM in which you want to configure NIC Teaming must be connected to both external virtual switches that you create. The Windows Server 2016 NIC Teaming solution supports teams with two members in VMs. Larger teams can be created but such teams are not supported. NIC Teams within a VM must have their Teaming mode configured as Switch Independent. In addition, Load Balancing mode for the NIC Team in a VM must be configured with the Address Hash distribution mode. <https://docs.microsoft.com/en-us/powershell/module/netlbfo/new-netlbfo-team?view=win10-ps> "-LoadBalancingAlgorithm TransportPorts" option uses the source and destination TCP ports and the IP addresses to create a hash and then assigns the packets that have the matching hash value to one of the available interfaces.
