NEW QUESTION: 1 A circuit level proxy is _____ when compared to an application level proxy.
A. more secure.
B. more difficult to maintain.
C. lower in processing overhead.
D. slower.

Answer: C
Explanation: Explanation/Reference: Explanation: A circuit level proxy works at the session layer of the OSI model and monitors traffic from a network-based view. This type of proxy cannot "look into" the contents of a packet like an application level proxy; thus, it does not carry out deep-packet inspection. This means that, compared to an application level proxy, a circuit level proxy is faster.
Incorrect Answers: B: A circuit level proxy is easier to maintain as it is less flexible.
C: A circuit level proxy is less secure since it only works at the session layer, and cannot inspect data packets.
D: A circuit level proxy is faster, not slower.

NEW QUESTION: 2 A. Option A B. Option B C. Option D D. Option C
Answer: C
Explanation: Windows Management Instrumentation (WMI) filters allow you to dynamically determine the scope of Group Policy objects (GPOs) based on attributes of the target computer. When a GPO that is linked to a WMI filter is applied on the target computer, the filter is evaluated on the target computer. If the WMI filter evaluates to false, the GPO is not applied (except if the client computer is running Windows Server, in which case the filter is ignored and the GPO is always applied). If the WMI filter evaluates to true, the GPO is applied.
