**NEW QUESTION: 1** Billy is the project manager of the HAR Project and is in month six of the project. The project is scheduled to last for 18 months. Management asks Billy how often the project team is participating in risk reassessment in this project. What should Billy tell management if he's following the best practices for risk management? **A.** Project risk management happens at every milestone. **B.** At every status meeting the project team project risk management is an agenda item. **C.** Project risk management is scheduled for every month in the 18-month project. **D.** Project risk management has been concluded with the project planning. **Answer: B** Explanation: Explanation/Reference: Explanation: Risk management is an ongoing project activity. It should be an agenda item at every project status meeting. Incorrect Answers: **A:** Risk management happens throughout the project as does project planning. **B:** Milestones are good times to do reviews, but risk management should happen frequently. **C:** This answer would only be correct if the project has a status meeting just once per month in the project.

**NEW QUESTION: 2** After making repairs to a user's system, which of the following actions should a technician take? **A.** Wait to update service records until the repair is confirmed **B.** Leave the case open in the event a similar issue arises **C.** Contact the customer a few days later to determine the state of repairs **D.** Close the case and wait for the customer to call again in the future **Answer: C** Explanation: Call the customer after a week or so and get the update on the repairs. Ask the customer about the state of repairs and how is the system performing. Get insight into any problems consumer is facing.

**NEW QUESTION: 3** What is the purpose of using the local-exec provisioner? (Select Two) **A.** Executes a command on the resource to invoke an update to the Terraform state. **B.** To invoke a local executable. **C.** To execute one or more commands on the machine running Terraform. **D.** Ensures that the resource is only executed in the local infrastructure where Terraform is deployed. **Answer: B, C** Explanation: Explanation The local-exec provisioner invokes a local executable after a resource is created. This invokes a process on the machine running Terraform, not on the resource. Note that even though the resource will be fully created when the provisioner is run, there is no guarantee that it will be in an operable state - for example

system services such as sshd may not be started yet on compute resources. Example usage  
resource "aws\_instance" "web" {  
 # ...provisioner "local-exec" {  
 command = "echo \${aws\_instance.web.private\_ip} >> private\_ips.txt"}  
}

Note: Provisioners should only be used as a last resort. For most common situations there are better alternatives.

**NEW QUESTION: 4** You are developing queries and stored procedures to support a line-of-business application. You need to use the appropriate isolation level based on the scenario. Which isolation levels should you implement? To answer, select the appropriate isolation level for each scenario in the answer area. Each isolation level may be used only once. NOTE: Each correct selection is worth one point.

**Answer:** Explanation: Explanation

Box 1: READ UNCOMMITTED  
Transactions running at the READ UNCOMMITTED level do not issue shared locks to prevent other transactions from modifying data read by the current transaction. READ UNCOMMITTED transactions are also not blocked by exclusive locks that would prevent the current transaction from reading rows that have been modified but not committed by other transactions. When this option is set, it is possible to read uncommitted modifications, which are called dirty reads. Values in the data can be changed and rows can appear or disappear in the data set before the end of the transaction.

Box 2: READ COMMITTED  
READ COMMITTED specifies that statements cannot read data that has been modified but not committed by other transactions.

SERIALIZABLE specifies that statements cannot read data that has been modified but not yet committed by other transactions.

Box 3: REPEATABLE READ  
REPEATABLE READ specifies that statements cannot read data that has been modified but not yet committed by other transactions and that no other transactions can modify data that has been read by the current transaction until the current transaction completes.

Box 4: SNAPSHOT  
If READ\_COMMITTED\_SNAPSHOT is set to ON, the Database Engine uses row versioning to present each statement with a transactionally consistent snapshot of the data as it existed at the start of the statement.
