NEW QUESTION: 2**A.** Option B**B.** Option A**C.** Option C**D.** Option D**Answer: C**Explanation: ExplanationSTP switch port states:+ Blocking - A port that would cause a switching loop if it were active. No user data is sent or received over a blocking port, but it may go into forwarding mode if the other links in use fail and the spanning tree algorithm determines the port may transition to the forwarding state. BPDU data is still received in blocking state.Prevents the use of looped paths.+ Listening - The switch processes BPDUs and awaits possible new information that would cause it to return to the blocking state. It does not populate the MAC address table and it does not forward frames.+ Learning - While the port does not yet forward frames it does learn source addresses from frames received and adds them to the filtering database (switching database). It populates the MAC address table, but does not forward frames.+ Forwarding - A port receiving and sending data, normal operation. STP still monitors incoming BPDUs that would indicate it should return to the blocking state to prevent a loop.+ Disabled - Not strictly part of STP, a network administrator can manually disable a port Source:

NEW QUESTION: 3Your application currently leverages AWS Auto Scaling to grow and shrink as load Increases' decreasesand has been performing well Your marketing team expects a steady ramp up in traffic to follow an upcoming campaign that will result in a 20x growth in traffic over 4 weeks Your forecast for the approximate number of Amazon EC2 instances necessary to meet the peak demand is 175.What should you do to avoid potential service disruptions during the ramp up in traffic?**A.** Pre-warm your Elastic Load Balancer to match the requests per second

anticipated during peak demand prior to the marketing campaign
B. Ensure that you have pre-allocated 175 Elastic IP addresses so that each server will be able to obtain one as it launches
C. Check the service limits in Trusted Advisor and adjust as necessary so the forecasted count remains within limits.
D. Change your Auto Scaling configuration to set a desired capacity of 175 prior to the launch of the marketing campaign
Answer: D

NEW QUESTION: 4 How is network layer addressing accomplished in the OSI protocol suite?
A. Media Access Control address
B. Authority and Format Identifier address
C. Internet Protocol address
D. Network Service Access Point address
E. Packet Layer Protocol address
Answer: D
Explanation: Explanation/Reference: Explanation: OSI network-layer addressing is implemented by using two types of hierarchical addresses: network service access-point addresses and network-entity titles. A network service-access point (NSAP) is a conceptual point on the boundary between the network and the transport layers. The NSAP is the location at which OSI network services are provided to the transport layer. Each transport-layer entity is assigned a single NSAP, which is individually addressed in an OSI internetwork using NSAP addresses. Network Service Address Point (NSAP) address is the equivalent of an IP address for an OSI network; A NSAP address is a hexadecimal address with a length of up to 40 hexadecimal digits. NSAP addresses are used in ATM and IS-IS.
