**NEW QUESTION: 3** Baldwin Museum of Science You need to recommend a domain controller deployment strategy for Branch2 that meets the museum's technical requirements. What should you recommend for Branch2? museum1 (exhibit): museum2 (exhibit): museum3 (exhibit): **A.** Deploy one read only domain controller (RODC) in baldwinmuseumofscience.com and one writable domain controller in ad.baldwinmuseumofscience. Enable universal group

membership caching. **B.** Deploy two writable domain controllers in ad.baldwinmuseumofscience. Configure both domain controllers as global catalog servers. **C.** Deploy two read only domain controllers (RODCs) in ad. baldwin museum of science. Configure both RODCs as global catalog servers. **D.** Deploy one writable domain controller in baldwinmuseumofscience.com and one writable domain controller in ad.baldwinmuseumofscience. Enable universal group membership caching. **Answer: B**  
Explanation: <http://technet.microsoft.com/en-us/library/dd735489%28WS.10%29.aspx>  
Read-only domain controllers (RODCs) do not introduce any significant new considerations for determining whether to make a branch domain controller a global catalog server. Global catalog placement generally requires planning unless you have a single-domain forest. In a single-domain forest, you can configure all domain controllers as global catalog servers without causing any additional replication or an increase in disk size or CPU usage. However, only domain controllers that are designated as global catalog servers can respond to global catalog queries on the global catalog Lightweight Directory Access Protocol (LDAP) port 3268. Designating all domain controllers as global catalog servers eliminates server or network capacity planning concerns about which domain controllers can respond to global catalog queries by applications or other domain controllers. In a multiple-domain forest, deciding whether a domain controller should be a global catalog server takes extra planning. As a general rule, it is best to make branch-office domain controllers (including branch-office RODCs) be global catalog servers so that authentication-and, generally, any global catalog query-can be performed by using just the RODC. This comes, however, at the price of replicating the partial attribute set for objects from every domain in the forest to the branch office, which may be expensive in terms of network and disk usage if some domains have large amounts of users, computers, or groups with a high rate of updates. If you determine that you cannot make the branch-office domain controller a global catalog server, you should enable universal group caching in that site. With universal group membership enabled, a domain controller must connect to a global catalog server across a wide area network (WAN) link only for initial logons in the site. Thereafter, universal group membership can be checked from a local cache.
