NEW QUESTION: 1 Refer to the exhibit. The two exhibited devices are the only Cisco devices on the network. The serial network between the two devices has a mask of 255.255.255.252. Given the output that is shown, what three statements are true of these devices? (Choose three.) **A.** The Manchester serial address is 10.1.1.1. **B.** The CDP information was sent by port Serial0/0 of the London router. **C.** The Manchester router is a Cisco 2610. **D.** The London router is a Cisco 2610. **E.** The Manchester serial address is 10.1.1.2. **F.** The CDP information was received on port Serial0/0 of the Manchester router. **Answer: A,D,F** Explanation: From the output, we learn that the IP address of the neighbor router is 10.1.1.2 and the question stated that the subnet mask of the network between two routers is 255.255.255.252. Therefore there are only 2 available hosts in this network ($2^2 - 2 = 2$). So we can deduce the IP address (of the serial interface) of Manchester router is 10.1.1.1 ->. The platform of the neighbor router is Cisco 2610, as shown in the output ->. Maybe the most difficult choice of this question is the answer E or F. Please notice that "Interface" refers to the local port on the local router, in this case it is the port of Manchester router, and "Port ID (outgoing port)" refers to the port on the neighbor router.

NEW QUESTION: 2 Which of the following authentication services requires the use of a ticket-granting ticket (TGT) server in order to complete the authentication process? **A.** Secure LDAP **B.** Kerberos **C.** TACACS+ **D.** RADIUS **Answer: B** Explanation: The basic process of Kerberos authentication is as follows: The subject provides login credentials. The Kerberos client system encrypts the password and transmits the protected credentials to the KDC. The KDC verifies the credentials and then creates a ticket-granting ticket (TGT - a hashed form of the subject's password with the addition of a time stamp that indicates a valid lifetime). The TGT is encrypted and sent to the client. The client receives the TGT. At this point, the subject is an authenticated principal in the Kerberos realm. The subject requests access to resources on a network server. This causes the client to request a service ticket (ST) from the KDC. The KDC verifies that the client has a valid TGT and then issues an ST to the client. The ST includes a time stamp that indicates its valid lifetime. The client receives the ST. The client sends the ST to the network server that hosts the desired resource. The network server verifies the ST. If it's verified, it initiates a communication session with the client. From this point forward, Kerberos is no longer involved. Incorrect Answers: A. TACACS+ makes use of Kerberos as an authentication mechanism. B. Lightweight Directory Access Protocol is used to allow clients to interact with directory service resources. Secure LDAP is the implementation of LDAP using security, such as protected authentication and encrypted data exchanges, specifically provided by SASL. C. Radius does not make use of tickets.
