NEW QUESTION: 1You are deploying a Microsoft SQL Server database that will support a mixed OLTP and OLAP workload. The target virtual machine has four CPUs.You need to ensure that reports do not use all available system resources.What should you do?**A.** Increase the value for the Minimum System Memory setting.**B.** Set MAXDOP to half the number of CPUs available.**C.** Increase the value for the Minimum Memory per query setting.**D.** Enable Auto Close.**Answer: B**
Explanation:When an instance of SQL Server runs on a computer that has more than one microprocessor or CPU, it detects the best degree of parallelism, that is, the number of processors employed to run a single statement, for each parallel plan execution. You can use the max degree of parallelism option to limit the number of processors to use in parallel plan execution.

NEW QUESTION: 2You need to implement the requirements for the playback of media.What should you do? (Each correct answer presents part of the solution. Choose all that apply.)**A.** Add the following line of code at line MC10.ptMgr.PlayRequested += SourceRequestHandler;**B.** Add the following line of code at line MC05.ptMgr.SourceRequested += SourceRequestHandler;**C.** Add the following line of code at line MC02.private void ShowPlayTo(){ Windows.Media.PlayTo.PlayToManager.ShowPlayToUI();}**D.** Add the following line of code at line MC06.ptMgr.DefaultSourceSelection = false;**Answer: B,D**

NEW QUESTION: 3The ip helper-address command does what?**A.** assigns an IP address to a

host **B.** relays a DHCP request across networks **C.** resolves an IP address from a DNS server **D.** resolves an IP address overlapping issue
Answer: B
Explanation: When the DHCP client sends the DHCP request packet, it doesn't have an IP address. So it uses the all-zeroes address, 0.0.0.0, as the IP source address. And it doesn't know how to reach the DHCP server, so it uses a general broadcast address, 255.255.255.255, for the destination. So the router must replace the source address with its own IP address, for the interface that received the request. And it replaces the destination address with the address specified in the ip helper-address command. The client device's MAC address is included in the payload of the original DHCP request packet, so the router doesn't need to do anything to ensure that the server receives this information.

NEW QUESTION: 4 A company is investigating memory issues with a VMware vSphere implementation. How would the company determine if there are memory issues at the host level when monitoring through a vSphere vCenter Server?
A. Check Swap-in level **B.** Check Active Memory level **C.** Check Memory Balloon Activity **D.** Check Consumed Memory level
Answer: A
