**B.** First the COTS server IP address and then the port number  
**C.** First the COTS server port number and then the IP address  
**D.** First the domain name and then the host name  
**Answer: A**

**NEW QUESTION: 2** **A.** Option B **B.** Option C **C.** Option D **D.** Option A  
**Answer: A**  
**Explanation:** The TransactionScope class establishes an ambient transaction in .NET. (An "ambient transaction" is one that lives in the current thread.) All connections opened within the TransactionScope participate in the transaction. If different databases participate, the transaction is automatically elevated to a distributed transaction. The outcome of the transaction is controlled by setting the scope to complete to indicate a commit.  
**Note:** Elastic database transactions for SQL DB enable applications to make atomic changes to data stored in several different SQL Databases. Elastic database transactions targets the following scenarios:  
\* Multi-database applications in Azure: With this scenario, data is vertically partitioned across several databases in SQL DB such that different kinds of data reside on different databases. Some operations require changes to data which is kept in two or more databases. The application uses elastic database transactions to coordinate the changes across databases and ensure atomicity. Etc.
