NEW QUESTION: 2A cloud architect has determined that the cloud management infrastructure requires an authentication and PKI environment. In addition, each tenant will require its own authentication and PKI environment.What describes these separate environments in a cloud design document?**A. Trust zonesB. Fault domainsC. Availability zonesD. Multi-tenancyAnswer: D**
Explanation:The term "software multitenancy" refers to a software architecture in which a single instance of software runs on a server and serves multiple tenants. A tenant is a group of users who share a common access with specific privileges to the software instance.**Incorrect:** Not A: Availability zones (AZs) are isolated locations within data center regions from which public cloud services originate and operate.**Not B:** A fault domain is a set of hardware components - computers, switches, and more - that share a single point of failure.**Not D:** Zones of trust are a defined area of the system where by by necessity, by the presence of key information assets and by the wider environmental context the connections within the zone are treated as at the same level of trust. This effectively couples the components within that subsystem for security purposes.**References:**<https://en.wikipedia.org/wiki/Multitenancy>

NEW QUESTION: 3Your company deploys an Azure App Service Web App.During testing the application fails under load. The application cannot handle more than 100 concurrent user sessions. You enable the Always On feature. You also configure auto-scaling to increase counts from two to10 based on HTTP queue length.You need to improve the performance of the application.Which solution should you use for each application scenario? To answer, select the appropriate options in the answer area.**NOTE:** Each correct selection is worth one point.
Answer: **Explanation:****Explanation**Box 1: Content Delivery NetworkA content delivery network (CDN) is a distributed network of servers that can efficiently deliver web content to users. CDNs store cached content on edge servers in point-of-presence (POP) locations that are close to end users, to minimize latency.**Azure Content Delivery Network (CDN)** offers developers a global

solution for rapidly delivering high-bandwidth content to users by caching their content at strategically placed physical nodes across the world. Azure CDN can also accelerate dynamic content, which cannot be cached, by leveraging various network optimizations using CDN POPs. For example, route optimization to bypass Border Gateway Protocol (BGP).

Box 2: Azure Redis Cache
Azure Cache for Redis is based on the popular software Redis. It is typically used as a cache to improve the performance and scalability of systems that rely heavily on backend data-stores. Performance is improved by temporarily copying frequently accessed data to fast storage located close to the application. With Azure Cache for Redis, this fast storage is located in-memory with Azure Cache for Redis instead of being loaded from disk by a database.
