Photoexperienceacademy's products are absolutely exam-oriented.

NEW QUESTION: 1 DRAG DROP Your network contains an Active Directory domain named contoso.com. The domain contains two servers named Server1 and Server3. The network contains a standalone server named Server2. All servers run Windows Server 2012 R2. The servers are configured as shown in the following table. Server3 hosts an application named App1. App1 is accessible internally by using the URL <https://app1.contoso.com>. App1 only supports Integrated Windows authentication. You need to ensure that all users from the Internet are pre-authenticated before they can access App1. What should you do? To answer, drag the appropriate servers to the correct actions. Each server may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

Answer: Explanation: Box 1: Server1 For all types of application that you can publish using AD FS preauthentication, you must add a AD FS relying party trust to the Federation Service. Use Server1 as it has AD FS. Box 2: Server2 When publishing applications that use Integrated Windows authentication, the Web Application Proxy server uses Kerberos constrained delegation to authenticate users to the published application. Box 3: Server2 To publish a claims-based application 1. On the Web Application Proxy server, in the Remote Access Management console, in the Navigation pane, click Web Application Proxy, and then in the Tasks pane, click Publish. 2. On the Publish New Application Wizard, on the Welcome page, click Next. Etc. Box 4: Server2 Configure CAs and certificates (see c below) Web Application Proxy servers require the following certificates in the certificate store on each Web Application Proxy server: a) A certificate whose subject covers the federation service name. If you want to use Workplace Join, the certificate must also contain the following subject alternative names (SANs): <federation service name>.<domain> and enterpriseregistration.<domain>. b) A wildcard certificate, a subject alternative name (SAN) certificate, several SAN certificates, or several certificates whose subjects cover each web application. c) A copy of the certificate issued to external servers when using client certificate preauthentication. Reference: Install and Configure the Web Application Proxy Server; Planning to Publish Applications Using Web Application Proxy; Publish Applications using AD FS Preauthentication

NEW QUESTION: 2 A small business with an IP SAN and NAS storage is experiencing slow

response times on the servers which have NAS storage resources. Which two should the storage administrator monitor to determine the root cause? (Choose two.) **A.** IOPS per NAS port **B.** Latency per NAS port **C.** Link speed per NAS port **D.** MBps per NAS port

Answer: B,E

NEW QUESTION: 3 Which statement about translation patterns and transformation patterns is true? **A.** Translation patterns support numeric and alphanumeric values, whereas transformation patterns support only numeric values. **B.** Transformation patterns support numeric and alphanumeric values, whereas translation patterns support only numeric values. **C.** Both transformation patterns and translation patterns support numeric and alphanumeric values. **D.** Both transformation patterns and translation patterns support only numeric values.

Answer: C

NEW QUESTION: 4 다음 보안이 구성된 EC2 인스턴스가 있습니다. 에이. 보안 그룹에서 ICMP 인바운드 허용. 비. 보안 그룹에서 ICMP 아웃 바운드가 구성되지 않았습니다. 씨. 네트워크 ACL에서 ICMP 인바운드 허용. 디. 네트워크 ACL에서 ICMP 아웃 바운드 거부. 인스턴스에 플로우 로그가 사용 가능한 경우 다음 플로우 레코드 중 어떤 레코드가 기록됩니까? 아래 옵션에서 3 가지 답변을 선택하십시오. 선택하십시오 : **A.** NACL 기반 요청에 대한 ACCEPT 레코드 **B.** 보안 그룹 기반 요청에 대한 ACCEPT 레코드 **C.** 보안 그룹을 기반으로 한 응답에 대한 거부 레코드 **D.** NACL을 기반으로 한 응답에 대한 거부 레코드

Answer: A,B,D
Explanation:
This example is given in the AWS documentation as well. For example, you use the ping command from your home computer (IP address is 203.0.113.12) to your instance (the network interface's private IP address is 172.31.16.139). Your security group's inbound rules allow ICMP traffic and the outbound rules do not allow ICMP traffic however, because security groups are stateful, the response ping from your instance is allowed. Your network ACL permits inbound ICMP traffic but does not permit outbound ICMP traffic. Because network ACLs are stateless, the response ping is dropped and will not reach your home computer. In a flow log, this is displayed as 2 flow log records: An ACCEPT record for the originating ping that was allowed by both the network ACL and the security group, and therefore was allowed to reach your instance. A REJECT record for the response ping that the network ACL denied. Option C is invalid because the REJECT record would not be present. For more information on Flow Logs, please refer to the below URL:

<http://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/flow-logs.html>
The correct answers are: An ACCEPT record for the request based on the Security Group, An ACCEPT record for the request based on the NACL, A REJECT record for the response based on the NACL
