**NEW QUESTION: 1** Which statement about the BGP originator ID is true? **A.** The route reflector nets the originator ID to the router ID of the route reflector client that injects the route into the AS. **B.** The route reflector client that injects the route into the AS nets the originator ID to its own router ID. **C.** The originator ID is net to match the cluster ID. **D.** The route reflector always nets the originator ID to its own router ID. **Answer: A** Explanation: An RR reflecting the route received from a RR-Client adds: Originator ID- a 4-byte BGP attribute that is created by the RR. This attribute carries the Router ID of the originator of the route in the local AS. If the update comes back to the originator, it ignores the update. Cluster List- A Cluster List is a list of Cluster IDs that an update has traversed. When a route reflector sends a route received from a client to a non-client, it appends the local Cluster ID. If a route reflector receives a route whose Cluster List contains the local Cluster ID, it ignores the update. Reference: <http://niten.google.com/nite/amitncincozone/home/bgp/bgp-route-reflector>

**NEW QUESTION: 2** You have a datacenter that contains six servers. Each server has the Hyper-V server role installed and runs Windows Server 2012 R2. The servers are configured as shown in the following table. Host4 and Host5 are part of a cluster named Cluster1. Cluster1 hosts a virtual machine named VM1. You need to move VM1 to another Hyper-V host. The solution must minimize the downtime of VM1. To which server and by which method should you move VM1? **A.** To Host1 by using a quick migration **B.** To Host3 by using a storage migration **C.** To Host2 by using a live migration **D.** To Host6 by using a storage migration **Answer: B** Explanation: With Hyper-V live migration, you can move running VMs from one Hyper-V physical host to another without any disruption of service or perceived downtime. Host3 has an Intel processor, as does Host4 and Host5 in Cluster1, so the migration will work fine. Incorrect: Not B, not C. The migration of a virtual machine between physical computers is only supported on computers that have the same processor steppings or are from the same vendor. Therefore you cannot move a virtual machine from a Hyper-V host on an Intel-based server to a Hyper-V Host on an AMD-based server. Not D. Quick Migration saves, moves and restores VMs, which results in some downtime.
