NEW QUESTION: 1You are the virtualization administrator for an organization that manages private and public cloud- based resources. The organization uses Windows Server 2012 R2 servers that have the Hyper-V role installed.All Hyper-V host servers are configured as nodes in a four-node cluster. The organization also uses System Center 2012 R2 Configuration Manager. Operating system updates to each host server require a system reboot. You need to ensure that the virtual machines remain online during any reboots required by the updates.What should you do?**A.** Configure orchestrated updates of Hyper-V host clusters in System Center 2012 R2 Virtual Machine Manager (VMM).**B.** In System Center 2012 R2 Configuration Manager, add all of the servers to a collection. Deploy updates to the collection.**C.** Apply updates by using the Virtual Machine Servicing Tool (VMST).**D.** Implement cluster-aware updating with the Cluster-Aware Updating (CAU) wizard.**Answer: D**Explanation:Explanation/Reference: Explanation:CAU is a tool that coordinates software updates on a cluster node, and

Configuration Manager also performs server software updates. It is important to configure these tools so that they do not have overlapping coverage of the same servers in any data-center deployment. This ensures that the objective behind using CAU is not inadvertently defeated, because Configuration Manager-driven updating does not incorporate cluster awareness. CAU and Configuration Manager can work together to deliver synergistic value. By using the public plug-in interface architecture in CAU, Configuration Manager can leverage the cluster awareness of CAU. This allows a customer who already has Configuration Manager deployed to use the cluster awareness capabilities of CAU while taking advantage of the Configuration Manager infrastructure, such as distribution points, approvals, and the Configuration console. NEW QUESTION: 3A. Option CB. Option EC. Option BD. Option DE. Option A Answer: A,D,E

Explanation: Each of routers running link-state routing protocol learns paths to all the destinations in its "area" so we can say although it is a bit unclear. Link-state routing protocols generate routing updates only (not the whole routing table) when a change occurs in the network topology so Link-state routing protocol like OSPF uses Dijkstra algorithm to calculate the shortest path ->. Unlike Distance vector routing protocol (which utilizes frequent periodic updates), link-state routing protocol utilizes event-triggered updates (only sends update when a change occurs)->
