NEW QUESTION: 1 InstructionsOS識別のステータスは何ですか？**A.**
すべてのネットワークでパッシブOSフィンガープリントが有効になっています。**B.**
10.0.0.0/24ネットワークでのみOSマッピングとARRを有効にするように構成されています。**C.**
OSマッピング情報は、リスクレーティングの計算には使用されません。**D.**
静的にマッピングされたOSフィンガープリントを使用して「Cisco
IOS」OSを識別することのみ可能です**Answer: A**Explanation:Understanding Passive OS FingerprintingPassive OS fingerprinting lets the sensor determine the OS that hosts are running. The sensor analyzes network traffic between hosts and stores the OS of these hosts with their IP addresses. The sensor inspects TCP SYN and SYNACK packets exchanged on the network to determine the OS type.The sensor then uses the OS of the target host OS to determine the relevance of the attack to the victim by computing the attack relevance rating component of the risk rating. Based on the relevance of the attack, the sensor may alter the risk rating of the alert for the attack and/or the sensor may filter the alert for the attack. You can then use the risk rating to reduce the number of false positive alerts (a benefit in IDS mode) or definitively drop suspicious packets (a benefit in IPS mode). Passive OS fingerprinting also enhances the alert output by reporting the victim OS, the source of the OS identification, and the relevance to the victim OS in the alert.Passive OS fingerprinting consists of three components:* Passive OS learningPassive OS learning occurs as the sensor observes traffic on the network. Based on the characteristics of TCP SYN and SYNACK packets, the sensor makes a determination of the OS running on the host of the source IP address.* User-configurable OS identificationYou can configure OS host mappings, which take precedence over learned OS mappings.* Computation of attack relevance rating and risk rating.
