フォルダ名の先頭にランダムな16進ハッシュを付ける。例えば、s3://BUCKET/

23a6-FOLDERNAME/FILENAME.zipのようになります。**Answer: D**
Explanation:ExplanationRefer AWS documentation - S3 PerformanceAmazon S3 maintains an index of object key names in each AWS region. Object keys are stored in UTF-8 binary ordering across multiple partitions in the index. The key name dictates which partition the key is stored in. Using a sequential prefix, such as time stamp or an alphabetical sequence, increases the likelihood that Amazon S3 will target a specific partition for a large number of your keys, overwhelming the I/O capacity of the partition. If you introduce some randomness in your key name prefixes, the key names, and therefore the I/O load, will be distributed across more than one partition.If you anticipate that your workload will consistently exceed 100 requests per second, you should avoid sequential key names. If you must use sequential numbers or date and time patterns in key names, add a random prefix to the key name. The randomness of the prefix more evenly distributes key names across multiple index partitions. Examples of introducing randomness are provided later in this topic.One way to introduce randomness to key names is to add a hash string as prefix to the key name. For example, you can compute an MD5 hash of the character sequence that you plan to assign as the key name. From the hash, pick a specific number of characters, and add them as the prefix to the key name. The following example shows key names with a four-character hash

NEW QUESTION: 3

どのFirePOWERプロトコルがルーテッドまたはハイブリッドインターフェイス上のIPv4およびIPv6アドレスにゲートウェイ冗長性を提供しますか？**A. SFRP****B. ECLBC****C. OSPF****D. WCCP****Answer: A**

Explanation: SFRP You can configure Cisco Redundancy Protocol (SFRP) to achieve network redundancy for high availability on either a 7000 or 8000 Series device high-availability pair or individual devices. SFRP provides gateway redundancy for both IPv4 and IPv6 addresses. You can configure SFRP on routed and hybrid interfaces. If the interfaces are configured on individual devices, they must be in the same broadcast domain. You must designate at least one of the interfaces as master and an equal number as backup. The system supports only one master and one backup per IP address. If network connectivity is lost, the system automatically promotes the backup to master to maintain connectivity. The options you set for SFRP must be the same on all interfaces in a group of SFRP interfaces. Multiple IP addresses in a group must be in the same master/ backup state. Therefore, when you add or edit an IP address, the state you set for that address propagates to all the addresses in the group. For security purposes, you must enter values for Group ID and Shared Secret that are shared among the interfaces in the group. To enable SFRP IP addresses on a virtual router, you must also configure at least one non-SFRP IP address. For 7000 or 8000 Series devices in a high-availability pair, you designate the shared secret and the system copies it to the high-availability pair peer along with the SFRP IP configuration. The shared secret authenticates peer data. Link:
