NEW QUESTION: 2Your network contains a server named Server1 that runs Windows Server 2012. Server1 has the Hyper-V server role installed.Server1 hosts four virtual machines named VM1, VM2, VM3, and VM4. Server1 is configured as shown in the following table.You plan to schedule a complete backup of Server1 by using Windows Server Backup.You need to ensure that the state of VM1 is saved before the backup starts.What should you configure?**A.** resource metering**B.** the VLAN ID**C.** Single-root I/O virtualization**D.** Processor Compatibility**E.** NUMA topology**F.** Port mirroring**G.** the startup order**H.** Automatic Start Action**I.** Resource control**J.** virtual Machine Chimney**K.** Integration Services**Answer: K**Explanation:What is the Hyper-V Saved State?Some Hyper-V virtual machines briefly go offline into a "Saved State" at the initial phase of a backup.While the backup is running, they usually come back online after a couple of seconds.Background KnowledgeThe decision to pull Hyper-V virtual machines offline into a

SavedState is done solely within Hyper-VMangement Services.Backup software utilities have no way to force a live backup when Hyper-V determines itcan't and shouldn't bedone.There are many factors that are considered by Hyper-V when itdecides whether to take a VM offline or not,Hyper-V Live Backup Requirements:To achieve zero downtime live backups of virtual machines, you need the followingconditions met:1.The VM guest needs to have Integration Services installed, enabled, and running (COM+ System Application Service, Distributed Transaction Coordinator Service, and Volume Shadow Copy Service). Also review the VM settings in Hyper-V, the 'backup' option needs to be checked.2.All disks involved need to be formatted with NTFS, including the disks within the VM.3.The Volume Shadow Copy Service and related VSS services need to be enabled and running.4.The shadow copy storage space for each drive must be available to Hyper-V VSS Writer and be located atthe same volume. For instance, the storage space for drive C: needs to be on drive C: itself, and so on. Use the VSSADMIN command from the command line to check the settings. (Use: vssadmin list shadowstorage /vssadmin resize shadowstorage)5.Ensure the VMs are partitioned using 'basic disk' formatting. At the moment Hyper-V does not support livebackup for VMs formatted using dynamic disk partitioning or GPT.7.Ensure you have at least about 20% free space on each drive involved, such as the drive on the host andthe VM's main system drive.8.Ensure plenty of un-fragmented RAM is available on the host. If a machine is pulled into Saved State, Hyper-V may not be able to bring the VM back online if it can't allocate a continuous block of RAM. Note that there may be sufficient total RAM available but not enough to place a single block. You should therefore aim to keep at least 512 MB to 1 GB of RAM free when all VMs are powered up.
