NEW QUESTION: 4In a PfR environment, which two statements best describe the difference between active mode monitoring and fast mode monitoring? (Choose two.)**A.** Fast mode monitoring can measure bursty traffic better than active mode.**B.** Active mode monitoring uses IP SLA probes for the purpose of obtaining performance characteristics of the current WAN exit link.**C.** Active mode monitoring can monitor and measure actual traffic via NetFlow data collection.**D.** Fast mode monitoring uses IP SLA probes via all valid exits continuously to quickly determine an alternate exit link.**Answer: B,D**Explanation:Active Monitoring PfR uses Cisco IOS IP Service Level Agreements (SLAs) to enable active monitoring. IP SLAs support is enabled by default. IP SLAs support allows PfR to be configured to send active probes to target IP

addresses to measure the jitter and delay, determining if a prefix is out-of-policy and if the best exit is selected. The border router collects these performance statistics from the active probe and transmits this information to the master controller. Fast Failover Monitoring Fast failover monitoring enables passive and active monitoring and sets the active probes to continuously monitor all the exits (probe-all). Fast failover monitoring can be used with all types of active probes: Internet Control Message Protocol (ICMP) echo, jitter, TCP connection, and UDP echo. Reference.
