NEW QUESTION: 1 Given the following partial configuration for Router A:interface serial 0ip address 10.1.1.1 255.255.255.0encapsulation frame-relayip ospf network point-to-multipoint router ospf 7network 10.1.1.0 0.0.0.255 area 0Which two statements are correct? (Choose two.)
A. OSPF neighbor statements are not necessary.**B.** DR/BDR elections do not take place.**C.** The area 0 NBMA cloud is configured as more than one subnet.**D.** The router is restricted to a hub and spoke topology.**Answer: A,B**Explanation:In an OSPF Point-to-Multipoint environment, DB/BDR elections do not take place.The neighbor command became somewhat obsolete with the introduction of the capability toconfigure other network modes for the interface, regardless of the underlying physical topology.Reference: Building Scalable Cisco Networks (Cisco Press) page 130 and 181Point-to-Multipoint Network:Point-to-multipoint is a single interface that connects to multiple destinations. The underlyingnetwork treats the network as a series of point-to-point circuits. It replicates LSA packets for eachcircuit. OSPF traffic is sent as multicast. There is no DR or BDR election. This technology usesone IP subnet for all endpoints on the network.By default, the network is considered to be a series of point-to-point interfaces. There is no need to specify neighbors, because the neighbors will see each other and simply become adjacent, with no need for the election of a DR or a BDR. Point-to-multipoint does not try to reduce adjacencies using a DR. Instead, it accepts the extra overhead of having a full set of adjacencies for the sake of stability. Point-to-multipoint forms an adjacency automatically along any PVC, which causes more overhead but is more resilient than NBMA.
