By using ACL, which of the following would be filtered to ensure only the authorized laptop can access the WAP?**A. NetBIOS name filtering B. Computer name filteringC. IP address filteringD. MAC address filtering****Answer: D**
Explanation:MAC Filtering (or EUI filtering, or layer 2 address filtering) refers to a security access control method whereby the 48-bit address assigned to each network card is used to determine access to the network.MAC addresses are uniquely assigned to each card, so using MAC filtering on a network permits and denies network access to specific devices through the use of blacklists and whitelists. While the restriction of network access through the use of lists is straightforward, an individual person is not identified by a MAC address, rather a device only, so an authorized person will need to have a whitelist entry for each device that he or she would use to access the network.
