NEW QUESTION: 1 Identify the LAN topology from below diagram presented below:bus topology**A.** Ring**B.** Bus**C.** Star**D.** Mesh**Answer: B**Explanation:Explanation/Reference:For your exam you should know the information below related to LAN topologies:LAN Topologies Network topology is the physical arrangement of the various elements (links, nodes, etc.) of a computer network.Essentially, it is the topological structure of a network, and may be depicted physically or logically. Physical topology refers to the placement of the network's various components, including device location and cable installation, while logical topology shows how data flows within a network, regardless of its physical design.Distances between nodes, physical interconnections, transmission rates, and/or signal types may differ between two networks, yet their topologies may be identical.BusIn local area networks where bus topology is used, each node is connected to a single cable. Each computer or server is connected to the single bus cable. A signal from the source travels in both directions to all machines connected on the bus cable until it finds the intended recipient. If the machine address does not match the intended address for the data, the machine ignores the data. Alternatively, if the data matches the machine address, the data is accepted. Since the bus topology consists of only one wire, it is rather inexpensive to implement when compared to other topologies. However, the low cost of implementing the technology is offset by the high cost of managing the network. Additionally, since only one cable is utilized, it can be the single point of failure. If the network cable is terminated on both ends and when without termination data transfer stop and when cable breaks, the entire network will be down.Bus topologyGraphic from: http://www.technologyuk.net/telecommunications/networks/images/bus_topology.gif Linear busThe type of network topology in which all of the nodes of the network are connected to a common transmission medium which has exactly two endpoints (this is the 'bus', which is also commonly referred to as the backbone, or trunk) - all data that is transmitted between nodes in the network is transmitted over this common transmission medium and is able to be received by all nodes in the network simultaneously.Distributed busThe type of network topology in which all of the nodes of the network are connected to a common transmission medium which has more than two endpoints that are created by adding branches to the main section of the transmission medium - the physical distributed bus topology functions in exactly the same fashion as the physical linear bus topology (i.e., all nodes share a common transmission medium).StarIn local area networks with a star topology, each network host is connected to a central point with a point- to-point connection. In Star topology every node (computer

workstation or any other peripheral) is connected to central node called hub or switch.The switch is the server and the peripherals are the clients. The network does not necessarily have to resemble a star to be classified as a star network, but all of the nodes on the network must be connected to one central device.All traffic that traverses the network passes through the central point. The central point acts as a signal repeater.The star topology is considered the easiest topology to design and implement. An advantage of the star topology is the simplicity of adding additional nodes. The primary disadvantage of the star topology is that the central point represents a single point of failure.Star TopologyImage from: http://fcit.usf.edu/network/chap5/pics/star.gifRingA network topology that is set up in a circular fashion in which data travels around the ring in one direction and each device on the ring acts as a repeater to keep the signal strong as it travels. Each device incorporates a receiver for the incoming signal and a transmitter to send the data on to the next device in the ring.The network is dependent on the ability of the signal to travel around the ring. When a device sends data, it must travel through each device on the ring until it reaches its destination. Every node is a critical link. If one node goes down the whole link would be affected.Ring TopologyImage from: https://forrester-infosystems.wikispaces.com/MeshThe value of a fully meshed networks is proportional to the exponent of the number of subscribers, assuming that communicating groups of any two endpoints, up to and including all the endpoints, is approximated by Reed's Law.A mesh network provides for high availability and redundancy. However, the cost of such network could be very expensive if dozens of devices are in the mesh. Mesh TopologyImage from: http://www.technologyuk.net/telecommunications/networks/images/mesh_topology.gif Fully connected mesh topologyA fully connected network is a communication network in which each of the nodes is connected to each other. In graph theory it known as a complete graph. A fully connected network doesn't need to use switching nor broadcasting. However, its major disadvantage is that the number of connections grows quadratic ally with the number of nodes, so it is extremely impractical for large networks. A two-node network is technically a fully connected network.Partially connected mesh topologyThe type of network topology in which some of the nodes of the network are connected to more than one other node in the network with a point-to-point link - this makes it possible to take advantage of some of the redundancy that is provided by a physical fully connected mesh topology without the expense and complexity required for a connection between every node in the network.The following answers are incorrect:The other options presented are not valid.The following reference(s) were/was used to create this question:CISA review manual 2014, Page number 262

NEW QUESTION: 2 Refer to the exhibit. It was taken from the switch where the Cisco WLC connects to and for which the switch port to the Cisco WLC is configured to trust CoS. The customer has an SSID in place for their VoWLAN whose QoS profile has been set to Platinum. When the IP packet egresses the switch to which the Cisco WLC is connected, the switch interfaces are configured to use the mls qos trust dscp command, but a packet trace on the far end reveals that the DSCP marking is set to AF41 and not to EF. Which option can cause the IP packet to be remarked to the lower QoS value?**A.** A switch in the path remarks the binary value in the packet to 011.010.**B.** The DSCP configuration on the Cisco WLC is set to a DSCP of AF41.**C.** The CoS-to-DSCP mapping is incorrect.**D.** A policy map is applied to an interface by using the violate-action policed-dscp-transmit command.**Answer: C**

NEW QUESTION: 3 Note: This question is part of a series of questions that present the same scenario. Each question in theseries contains a unique solution that might meet the stated goals. Some question sets might have morethan one correct solution, while others might not have a correct solution.After you answer a question in this sections, you will NOT be able to return to it. As a result, thesequestions will not appear in the review screen.A company has an on-premises Microsoft SQL Server environment and Microsoft Azure SQL Databaseinstances. The environment hosts several customer databases.One customer reports that their database

is not responding as quickly as the service level agreementsdictate. You observe that the database is fragmented.You need to optimize query performance.Solution: You reorganize all indexes.Does the solution meet the goal?**A.** No**B.** Yes**Answer: B**Explanation:
Explanation/Reference:Explanation:You can remedy index fragmentation by either reorganizing an index or by rebuilding an index.References:
