This module also demonstrates how the resultsof the ICMP Echo operation can be displayed and analyzed to determine how the network IP connections areperforming.ICMP Echo OperationThe ICMP Echo operation

measures end-to-end response time between a Cisco router and any devices using IP. Response time is computed by measuring the time taken between sending an ICMP Echo request message to the destination and receiving an ICMP Echo reply. In the figure below ping is used by the ICMP Echo operation to measure the response time between the source IP SLAs device and the destination IP device. Many customers use IP SLAs ICMP-based operations, in-house ping testing, or ping-based dedicated probes for response time measurements. Figure 1. ICMP Echo Operation

The IP SLAs ICMP Echo operation conforms to the same IETF specifications for ICMP ping testing and the two methods result in the same response times. Configuring a Basic ICMP Echo Operation on the Source Device
