**NEW QUESTION: 2**You are a data engineer. You are designing a Hadoop Distributed File System (HDFS) architecture. You plan to use Microsoft Azure Data Lake as a data storage repository. You must provision the repository with a resilient data schema. You need to ensure the resiliency of the Azure Data Lake Storage. What should you use? To answer, select the appropriate options in the answer area. NOTE: Each correct selection is worth one point. **Answer:** Explanation: Explanation Box 1: NameNode An HDFS cluster consists of a single NameNode, a master server that manages the file system namespace and regulates access to files by clients. Box 2: DataNode The DataNodes are responsible for serving read and write requests from the file system's clients. Box 3: DataNode The DataNodes perform block creation, deletion, and replication upon instruction from the NameNode. Note: HDFS has a master/slave architecture. An HDFS cluster consists of a single NameNode, a master server that manages the file system namespace and regulates access to files by clients. In addition, there are a number of DataNodes, usually one per node in the cluster, which manage storage attached to the nodes

that they run on. HDFS exposes a file system namespace and allows user data to be stored in files. Internally, a file is split into one or more blocks and these blocks are stored in a set of DataNodes. The NameNode executes file system namespace operations like opening, closing, and renaming files and directories. It also determines the mapping of blocks to DataNodes. The DataNodes are responsible for serving read and write requests from the file system's clients. The DataNodes also perform block creation, deletion, and replication upon instruction from the NameNode. References:

**NEW QUESTION: 3** Your company has a private cloud that is managed by using a System Center 2012 Operations Manager infrastructure. The infrastructure contains a management server named Server1. The network contains two subnets named Subnet1 and Subnet2. The two subnets are separated by a firewall that prevents SNMP communications. Server1 is located on Subnet1. A switch named Switch1 is located on Subnet2. Switch1 has the following configurations: - Network ID: 172.23.1.0/23 - IPv4 address: 172.23.1.55 - IPv6 address: fec0:2308::12 You need to discover Switch1. What should you configure from the Computer and Device Management Wizard? To answer, drag the appropriate values to the correct location in the answer area. (Each value may be used once, more than once, or not at all.) Select and Place:

**Answer:** Explanation: Explanation: Explicit discovery - An explicit discovery rule will only attempt to discover those devices that you explicitly specify in the wizard by IP address or FQDN. It will only monitor those devices that it can successfully access. The rule will attempt to access the device by using ICMP, SNMP, or both depending on the configuration of the rule. <http://technet.microsoft.com/en-us/library/hh212935.aspx>
