Sie möchten eine neue Anwendung bereitstellen, die die Arbeitslast auf mindestens fünf verschiedene SQL Server-Instanzen skaliert. Sie müssen sicherstellen, dass Benutzer für jede Kopie der Datenbank Daten lesen und schreiben können, die dann zwischen allen Datenbankinstanzen synchronisiert werden. Welches Feature solltest du verwenden?
A. Failover-Clustering
B. Snapshot-Replikation
C. Datenbankprüfungen
D. Peer-to-Peer-Replikation
Answer: D
Explanation: Explanation Peer-to-peer replication provides a scale-out and high-availability solution by maintaining copies of data across multiple server instances, also referred to as nodes. Built on the foundation of transactional replication, peer-to-peer replication propagates transactionally consistent changes in near real-time. This enables applications that require scale-out of read operations to distribute the reads from clients across multiple nodes. Because data is maintained across the nodes in near real-time, peer-to-peer replication provides data redundancy, which increases the availability of data. Although peer-to-peer replication enables scaling out of read operations, write performance for the topology is like that for a single node. References:
