NEW QUESTION: 1An organization plans to deploy a spine/leaf network topology to support a cloud design. Leaf switches will use layer-3 protocols to communicate with the spine switches. Hosts will each connect to two leaf switches using layer-2 protocols. Which technology must be enabled between the host and leaf switches to provide the maximum throughput for a single data stream?
A. Generic Network Virtualization Encapsulation
B. Multi-Chassis Aggregation
C. Equal-Cost Multi-Path Routing
D. Spanning Tree Protocol
Answer: A
Explanation: Generic Network Virtualization Encapsulation (Geneve) is the peacemaking protocol drafted to unify VXLAN, NVGRE, and whatever other tunneling protocols emerge for network virtualization. Geneve doesn't exactly replace VXLAN and other protocols. Rather, it provides a common superset among them, so that outside software can provide hooks to Geneve rather than having to accommodate multiple encapsulation standards.
Note: NVGRE (Network Virtualization using Generic Routing Encapsulation) is a network virtualization technology that attempts to alleviate the scalability problems associated with large cloud computing deployments. It uses Generic Routing Encapsulation (GRE) to tunnel layer 2 packets over layer 3 networks. Its principal backer is Microsoft.

NEW QUESTION: 2Your network contains an Active Directory domain named contoso.com. Your company has an enterprise root certification authority (CA) named CA1. You plan to deploy Active Directory Federation Services (AD FS) to a server named Server1. The company purchases a Microsoft Office 365 subscription. You plan to register the company's SMTP domain for Office 365 and to configure single sign-on for all users. You need to identify which certificate is required for the planned deployment. Which certificate should you identify?
A. a server authentication certificate that is issued by a trusted third-party root CA and that contains the subject name Server1
B. a server authentication certificate that is issued by a trusted

third-party root CA and that contains the subject name server1.contoso.com
C. a server authentication certificate that is issued by CA1 and that contains the subject name server1.contoso.com
D. a server authentication certificate that is issued by CA1 and that contains the subject name Server1
E. a self-signed server authentication certificate for server1.contoso.com
Answer: B
Explanation:Explanation/Reference:Explanation:Prepare Your Server and Install ADFS
You can install ADFS on a domain controller or another server. You'll first need to configure a few prerequisites. The following steps assume you're installing to Windows Server 2008 R2. Using Server Manager, install the IIS role and the Microsoft .NET Framework. Then purchase and install a server-authentication certificate from a public certificate authority. Make sure you match the certificate's subject name with the Fully Qualified Domain Name of the server. Launch IIS Manager and import that certificate to the default Web site.

NEW QUESTION: 3 Your company deploys a new Active Directory forest named contoso.com. The first domain controller in the forest runs Windows Server 2012. The forest contains a domain controller named DC10. On DC10, the disk that contains the SYSVOL folder fails. You replace the failed disk. You stop the Distributed File System (DFS) Replication service. You restore the SYSVOL folder. You need to perform a non-authoritative synchronization of SYSVOL on DC10. Which tool should you use before you start the DFS Replication service on DC10?
A. Frsutil
B. Adsiedit.msc
C. Ultrasound
D. Dfsmgmt.msc
Answer: B
Explanation:How to perform a non-authoritative synchronization of DFSR-replicated SYSVOL (like "D2" for FRS) In the ADSIEDIT.MSC tool modify the following distinguished name (DN) value and attribute on each of the domain controllers that you want to make non-authoritative: CN=SYSVOL Subscription, CN=Domain System Volume, CN=DFSR- LocalSettings, CN=<the server name>, OU=Domain Controllers, DC=<domain> msDFSR-Enabled=FALSE Force Active Directory replication throughout the domain. Etc.
Note:* You want to force the non-authoritative synchronization of SYSVOL on a domain controller. In the File Replication Service (FRS), this was controlled through the D2 and D4 data values for the Burflags registry values, but these values do not exist for the Distributed File System Replication (DFSR) service. You cannot use the DFS Management snap-in (Dfsmgmt.msc) or the Dfsradmin.exe command-line tool to achieve this. Unlike custom DFSR replicated folders, SYSVOL is intentionally protected from any editing through its management interfaces to prevent accidents. Reference: How to force an authoritative and non-authoritative synchronization for DFSR- replicated SYSVOL (like "D4/D2" for FRS)

NEW QUESTION: 4 Host-Based Intrusion Protection (HIPS) systems are often deployed in monitoring or learning mode during their initial implementation. What is the objective of starting in this mode?
A. Automatically create exceptions for specific actions or files
B. Build a baseline of normal or safe system events for review
C. Determine which files are unsafe to access and blacklist them
D. Automatically whitelist actions or files known to the system
Answer: B
