NEW QUESTION: 1 Refer to the exhibit. Which two statements are correct? (Choose two.)
A. Logging is enabled for the access list.
B. Private is an identification of that ACE.
C. The Telnet connection is successfully set up.
D. The packet is received on the private interface.
E. Zone-Based Firewall is configured on the router.
Answer: A, B
Explanation: The log and log-input Access Control Entry Options The log and log-input options apply to an individual ACE and cause packets that match the ACE to be logged. The log-input option enables logging of the ingress interface and source MAC address in addition to the packet's source and destination IP addresses and ports. The first packet logged via the log or log-input options will generate a syslog message. There are two scenarios in which subsequent log messages will not be sent immediately. If the log-enabled ACE matches another packet with identical characteristics to the packet that generated a log message, the number of packets matched is incremented and then reported at five-minute intervals. Similarly, if any log-enabled ACE in any ACL on any interface matches a packet within one second of the initial log message, the match or matches are counted for five minutes and then reported. These periodic updates will contain the number of packets matched since the previous message.

NEW QUESTION: 2 Which of the following are channels? (Choose two.)
A. Web
B. Contacts
C. Article
D. Chat
Answer: A, D
Explanation: Explanation

NEW QUESTION: 3 You are using a decision tree algorithm. You have trained a model that generalizes well at a tree depth equal to 10. You need to select the bias and variance properties of the model with varying tree depth values. Which properties should you select for each tree depth? To answer, select the appropriate options in the answer area.
Answer: Explanation:
Explanation: In decision trees, the depth of the tree determines the variance. A complicated decision tree (e.g. deep) has low bias and high variance.
Note: In statistics and machine learning, the bias-variance tradeoff is the property of a set of predictive models whereby models with a lower bias in parameter estimation have a higher variance of the parameter estimates across samples, and vice versa. Increasing the bias will decrease the variance. Increasing the variance will decrease the bias.

NEW QUESTION: 4You create a batch inference pipeline by using the Azure ML SDK. You run the pipeline by using the following code:
`from azureml.pipeline.core import Pipeline
from azureml.core.experiment import Experiment
pipeline = Pipeline(workspace=ws,
steps=[parallel_run_step])
pipeline_run = Experiment(ws, 'batch_pipeline').submit(pipeline)`
You need to monitor the progress of the pipeline execution. What are two possible ways to achieve this goal? Each correct answer presents a complete solution. NOTE: Each correct selection is worth one point.
A. Option **A** **B.** Option **B** **C.** Option **C** **D.** Option **D** **E.** Option **E**
Answer: D,E
Explanation: Explanation A batch inference job can take a long time to finish. This example monitors progress by using a Jupyter widget. You can also manage the job's progress by using: * Azure Machine Learning Studio. * Console output from the PipelineRun object.
`from azureml.widgets import RunDetails
RunDetails(pipeline_run).show()
pipeline_run.wait_for_completion(show_output=True)`
