**NEW QUESTION: 1**What security model implies a central authority that define rules and sometimes global rules, dictating what subjects can have access to what objects?**A.** Non-discretionary access control**B.** Discretionary access control**C.** Mandatory access control**D.** Flow Model**Answer: A****Explanation:**As a security administrator you might configure user profiles so that users cannot change the system's time, alter system configuration files, access a command prompt, or install unapproved applications. This type of access control is referred to as nondiscretionary, meaning that access decisions are not made at the discretion of the user. Nondiscretionary access controls are put into place by an authoritative entity (usually a security administrator) with the goal of protecting the organization's most critical assets. Non-discretionary access control is when a central authority determines what subjects can have access to what objects based on the organizational security policy. Centralized access control is not an existing security model. Both, Rule Based Access Control (RuBAC or RBAC) and Role Based Access Controls (RBAC) falls into this category.**Reference(s) used for this question:** Harris, Shon (2012-10-18). **NEW QUESTION: 4**You are using a configuration management system to manage your Amazon EC2 instances. On your Amazon EC2 Instances, you want to store credentials for connecting to an Amazon RDS MYSQL DB instance. How should you securely store these credentials?**A.** Give the Amazon EC2 instances an 1AM role that allows read access to a private Amazon S3 bucket. Store a file with database credentials in the Amazon S3 bucket. Have your configuration management system pull the file from the bucket when it is needed.**B.** Assign an 1AM role to your Amazon EC2 instance, and use this 1AM role to access the Amazon RDS DB from your Amazon EC2 instances.**C.** Launch an Amazon EC2 instance and use the configuration

management system to bootstrap the instance with the Amazon RDS DB credentials. Create an AMI from this instance.**D.** Store the Amazon RDS DB credentials in Amazon EC2 user data. Import the credentials into the Instance on boot.**Answer: B**Explanation:ExplanationCreating and Using an IAM Policy for IAM Database AccessTo allow an IAM user or role to connect to your DB instance or DB cluster, you must create an IAM policy.After that you attach the policy to an IAM user or role.NoteTo learn more about IAM policies, see Authentication and Access Control for Amazon RDS.The following example policy allows an IAM user to connect to a DB instance using IAM database authentication.ImportantDon't confuse the rds-db: prefix with other Amazon RDS action prefixes that begin with rds:. You use the rds-db: prefix and the rds-db:connect action only for IAM database authentication. They aren't valid in any other context.IAM Database Authentication for MySQL and Amazon AuroraWith Amazon RDS for MySQL or Aurora with MySQL compatibility, you can authenticate to your DB instance or DB cluster using AWS Identity and Access Management (IAM) database authentication. With this authentication method, you don't need to use a password when you connect to a DB instance. Instead, you use an authentication token.An authentication token is a unique string of characters that Amazon RDS generates on request.Authentication tokens are generated using AWS Signature Version 4. Each token has a lifetime of 15 minutes.You don't need to store user credentials in the database, because authentication is managed externally using IAM. You can also still use standard database authentication.IAM database authentication provides the following benefits:\* Network traffic to and from the database is encrypted using Secure Sockets Layer (SSL).\* You can use IAM to centrally manage access to your database resources, instead of managing access individually on each DB instance or DB cluster.\* For applications running on Amazon EC2, you can use EC2 instance profile credentials to access the database instead of a password, for greater security.For more information please refer to the below document link from AWS\* <https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/UsingWithRDS.IAMDBAuth.html>\* <https://docs>

You can use roles to delegate access to users, applications, or services that don't normally have access to your AWS resources. For example, you might want to grant users in your AWS account access to resources they don't usually have, or grant users in one AWS account access to resources in another account. Or you might want to allow a mobile app to use AWS resources, but not want to embed AWS keys within the app (where they can be difficult to rotate and where users can potentially extract them). Sometimes you want to give AWS access to users who already have identities defined outside of AWS, such as in your corporate directory. Or, you might want to grant access to your account to third parties so that they can perform an audit on your resources. For more information on IAM Roles, please refer to the below document link: from AWS\* [http://docs.aws.amazon.com/IAM/latest/UserGuide/id\\_roles.html](http://docs.aws.amazon.com/IAM/latest/UserGuide/id_roles.html)
