NEW QUESTION: 1You need to configure security for the SSRS instance on SSRS01 to connect to SSAS and minimize downtime.What should you do? (Each correct answer presents part of the solution. Choose all that apply.)**A.** Configure SSRS01 to use the Custom authentication type.**B.** Register a service principal name for the Analysis Services service.**C.** Restart the IIS service.**D.** Register a service principal name for the Report Server service.**E.** Configure SSRS01 to use the Negotiate authentication type.**Answer: D,E**Explanation:A (not B): If you are deploying Reporting Services in a network that uses the Kerberos protocol for mutual authentication, you must create a Service Principal Name (SPN) for the Report Server service if you configure it to run as a domain user account.D (not E):*See step 6 below.

RSWindowsNegotiate. If you initially set the Windows service account for the report server to NetworkService or LocalSystem in Reporting Services Configuration Manager, RSWindowsNegotiate is added to the RSReportServer.config file as the default setting. With this setting, the report server can accept requests from client applications requesting Kerberos or NTLM authentication. If Kerberos is requested and the authentication fails, the report server switches to NTLM authentication and prompts the user for credentials unless the network is configured to manage authentication transparently.To register an SPN for a Report Server service running as a domain user Using RSWindowsNegotiate is your best option because it provides the greatest flexibility for multiple clients in an intranet environment.Not C: IIS is not mention in this scenario.Note: From scenario:/ A single-server deployment of SQL Server 2008 R2 Reporting Services (SSRS) in nativemode is installed on a server named SSRS01. The Reporting Server service is configuredto use a domain service account.Reference: Register a Service Principal Name (SPN) for a Report Server
