NEW QUESTION: 3 A security administrator is given the security and availability profiles for servers that are being deployed.* Match each RAID type with the correct configuration and MINIMUM number of drives.* Review the server profiles and match them with the appropriate RAID type based on integrity, availability, I/O, storage requirements. Instructions:* All drive definitions can be dragged as many times as necessary* Not all placeholders may be filled in the RAID configuration boxes* If parity is required, please select the appropriate number of parity checkboxes* Server profiles may be dragged only once RAID-0 is known as striping. It is not a fault tolerant solution but does improve disk performance for read/write operations. Striping requires a minimum of two disks and does not use parity. RAID-0 can be used where performance is required over fault tolerance, such as a media streaming server. RAID-1 is known as mirroring because the same data is written to two disks so that the two disks have identical data. This is a fault tolerant solution that halves the storage space. A minimum of two disks are used in mirroring and does not use parity. RAID-1 can be used where fault tolerance is required over performance, such as on an authentication server. RAID-5 is a fault tolerant solution that uses parity and striping. A minimum of three disks are required for RAID-5 with one disk's worth of space being used for parity information. However, the parity information is distributed across all the disks. RAID-5 can recover from a sing disk failure. RAID-6 is a fault tolerant solution that uses dual parity and striping. A minimum of four disks are required for RAID-6. Dual parity allows RAID-6 to recover from the simultaneous failure of up to two disks. Critical data should

be stored on a RAID-6 system.http://www.adaptec.com/en-us/solutions/raid_levels.html
