**NEW QUESTION: 1**An administrator is tasked with setting up an iSCSI solution on an ESXI 6.x host. To provide multiple paths to the iSCSI array, the administrator chooses to setup iSCSI Port Binding. Which three statements are true in regard to setting up iSCSI Port Binding? (Choose three.)  
**A.** Port binding cannot be used in conjunction with network routing.  
**B.** iSCSI VMkernel adapters must be on different virtual switches.  
**C.** All VMkernel adapters used for iSCSI connectivity must reside in the same virtual switch.  
**D.** iSCSI target array ports must reside in the same broadcast domain as the VMkernel adapters.  
**E.** Port binding works across multiple routers as long as the network mask is the same.  
**Answer: A,C,D**  
**Explanation:**  
Explanation/Reference: Explanation: Port binding is used in iSCSI when multiple VMkernel ports for iSCSI reside in the same broadcast domain and IP subnet to allow multiple paths to an iSCSI array that broadcasts a single IP address. When using port binding, you must remember that: Array Target iSCSI ports must reside in the same broadcast domain and IP subnet as the VMkernel port. All VMkernel ports used for iSCSI connectivity must reside in the same broadcast domain and IP subnet. All VMkernel ports used for iSCSI connectivity must reside in the same vSwitch. Currently, port binding does not support network routing. Reference: <https://kb.vmware.com/s/article/2038869>

**NEW QUESTION: 2** \*\*\*  
**A.** Option A  
**B.** Option B  
**Answer: A**  
**Explanation:** Application Gateway works at the application layer (Layer 7 in the OSI network reference stack). It acts as a reverse-proxy service, terminating the client connection and forwarding requests to back-end endpoints. It supports the HTTP, HTTPS, and WebSockets protocols. Application Gateway is useful for applications that require requests from the same user/client session to reach the same back-end virtual machine. Examples of these applications would be shopping cart applications and web mail servers. Traffic Manager works at the DNS level. It uses DNS responses to direct end-user traffic to globally distributed endpoints. Clients then connect to those endpoints directly. Microsoft Azure Traffic Manager allows you to control the distribution of user traffic for service endpoints in different datacenters

**NEW QUESTION: 3** Your network contains an Active Directory domain named contoso.com. All client computers run Windows 8. You deploy a server named Server1 that runs Windows Server

2012 R2. You install a new client-server application named App1 on Server1 and on the client computers. The client computers must use TCP port 6444 to connect to App1 on Server1. Server1 publishes the information of App1 to an intranet server named Server2 by using TCP port 3080. You need to ensure that all of the client computers can connect to App1. The solution must ensure that the application can connect to Server2. Which Windows Firewall rule should you create on Server1? **A.** an inbound rule to allow a connection to TCP port 6444 **B.** an outbound rule to allow a connection to TCP port 6444 **C.** an inbound rule to allow a connection to TCP port 3080 **D.** an outbound rule to allow a connection to TCP port 3080

**Answer: A** Explanation: Explanation/Reference: Explanation: Server1 gets request from Client PC's it needs an inbound rule for 6444. By default, Windows Firewall with Advanced Security blocks all unsolicited inbound network traffic, and allows all outbound network traffic. For unsolicited inbound network traffic to reach your computer, you must create an allow rule to permit that type of network traffic. If a network program cannot get access, verify that in the Windows Firewall with Advanced Security snap-in there is an active allow rule for the current profile. To verify that there is an active allow rule, double-click Monitoring and then click Firewall. If there is no active allow rule for the program, go to the Inbound Rules node and create a new rule for that program. Create either a program rule, or a service rule, or search for a group that applies to the feature and make sure all the rules in the group are enabled. To permit the traffic, you must create a rule for the program that needs to listen for that traffic. If you know the TCP or UDP port numbers required by the program, you can additionally restrict the rule to only those ports, reducing the vulnerability of opening up all ports for the program.
