NEW QUESTION: 3In the physical security context, a security door equipped with an electronic lock configured to ignore the unlock signals sent from the building emergency access control system in the event of an issue (fire, intrusion, power failure) would be in which of the following configuration?**A.** Fail Open**B.** Fail Soft**C.** Fail Secure**D.** Fail Safe**Answer: C****Explanation:**The context of this question is VERY important. As you can see, the question is in the Physical Security context where they make reference to a door electronic access control mechanism.In case of a power failure the door electronic lock would usually default to being unlocked which is called Fail Safe in the physical security context. This allow people to evacuate the building and make their way to a secure meeting point.If the signal is ignored the door will NOT become unlocked as it usually does. People may be trapped inside or they may be expected to remain inside to defend the facility, think of employment such as embassy security or other high security environment where your job description include risking your live to defend the facility and its occupant. This is referred to as Fail Secure. Everything will remain locked and people would not evacuate the facility. A synonym for Fail Secure is Fail Closed.Operations will be expected to ensure that fail-safe and fail-secure mechanisms are working correctly. While both

are concerned with how a system behaves when it fails, they are often confused with each other. It is important for the security professional to distinguish between them: Fail-safe mechanisms focus on failing with a minimum of harm to personnel, facility, or systems. Fail-secure focuses on failing in a controlled manner to block access while the systems or facility is in an inconsistent state. For example, data center door systems will fail safe to ensure that personnel can escape the area when the electrical power fails. A fail-secure door would prevent personnel from using the door at all, which could put personnel in jeopardy. Fail-safe and fail-secure mechanisms will need to be maintained and tested on a regular basis to ensure that they are working as designed. The other answers presented were not correct choices. See some definitions below:

Fail soft A system that experience a security issue would disable only the portion of the system being affected by the issue. The rest of the system would continue to function as expected. The component or service that failed would be isolated or protected from being abused.

Fail Safe A fail-safe lock in the PHYSICAL security context will default to being unlocked in case of a power interruption. A fail-safe mechanisms in the LOGICAL security context will default to being locked in case of problems or issues. For example if you have a firewall and it cannot apply the policy properly, it will default to NO access and all will be locked not allowing any packet to flow through without being inspected.

Fail open A Fail Open mean that the mechanism will default to being unlocked in case of a failure or problem. This is very insecure. If you have a door access control mechanism that fail open then it means that the door would be unlocked and anyone could get through. A logical security mechanism would grant access and there would be no access control in place.

Fail closed A Fail closed mechanism will default to being locked in case of a failure or problem. That would be a lot more secure than Fail Open for a logical access control mechanism.

Fail secure A fail-secure in the logical or physical security context will default to being locked in case of a power interruption or a service that is not functioning properly. Nobody could exit the building and nobody would be able to come in either. In case of the logical context there is no access granted and everything is locked.
