NEW QUESTION: 1The ISO/IEC 27001:2005 is a standard for:
A. Information Security Management System
B. Certification of public key infrastructures
C. Evaluation criteria for the validation of cryptographic algorithms
D. Implementation and certification of basic security measures
Answer: A
Explanation:The ISO 27000 Directory at: <http://www.27000.org/index.htm> has great coverage of the ISO 27000 series. The text below was extracted from their website. As mention by Belinda the ISO 27001 standard is the certification controls criteria while ISO 27002 is the actual standard. ISO 27002 used to be called ISO 17799 before being renamed. An Introduction To ISO 27001 (ISO27001)The ISO 27001 standard was published in October 2005, essentially replacing the old BS7799-2 standard. It is the specification for an ISMS, an Information Security Management System. BS7799 itself was a long standing standard, first published in the nineties as a code of practice. As this matured, a second part emerged to cover management systems. It is this against which certification is granted. Today in excess of a thousand certificates are in place, across the world. ISO 27001 enhanced the content of BS7799-2 and harmonized it with other standards. A scheme has been introduced by various certification bodies for conversion from BS7799 certification to ISO27001 certification. The objective of the standard itself is to "provide a model for establishing, implementing, operating, monitoring, reviewing, maintaining, and improving an Information Security Management System". Regarding its adoption, this should be a strategic decision. Further, "The design and implementation of an organization's ISMS is influenced by their needs and objectives, security requirements, the process employed and the size and structure of the organization". The standard defines its 'process approach' as "The application of a system of processes within an organization, together with the identification and interactions of these processes, and their management". It employs the PDCA, Plan-Do-Check-Act model to structure the processes, and reflects the principles set out in the OECG guidelines (see oecd.org).
THE CONTENTS OF ISO 27001
The content sections of the standard are: Management Responsibility Internal Audits ISMS Improvement Annex A - Control objectives and controls Annex B - OECD principles and this international standard Annex C - Correspondence between ISO 9001, ISO 14001 and this standard
Introduction To ISO 27002 (ISO27002)
The ISO 27002 standard is the rename of the ISO

17799 standard, and is a code of practice for information security. It basically outlines hundreds of potential controls and control mechanisms, which may be implemented, in theory, subject to the guidance provided within ISO 27001. The standard "established guidelines and general principles for initiating, implementing, maintaining, and improving information security management within an organization". The actual controls listed in the standard are intended to address the specific requirements identified via a formal risk assessment. The standard is also intended to provide a guide for the development of "organizational security standards and effective security management practices and to help build confidence in inter-organizational activities". The basis of the standard was originally a document published by the UK government, which became a standard 'proper' in 1995, when it was re-published by BSI as BS7799. In 2000 it was again re-published, this time by ISO, as ISO 17799. A new version of this appeared in 2005, along with a new publication, ISO 27001. These two documents are intended to be used together, with one complimenting the other. ISO's future plans for this standard are focused largely around the development and publication of industry specific versions (for example: health sector, manufacturing, and so on). Note that this is a lengthy process, so the new standards will take some time to appear.

THE CONTENTS OF ISO 17799 / 27002 The content sections are: Structure Risk Assessment and Treatment Security Policy Organization of Information Security Asset Management Human Resources Security Physical Security Communications and Ops Management Access Control Information Systems Acquisition, Development, Maintenance Information Security Incident management Business Continuity Compliance

NEW QUESTION: 2 Which of the following would not constitute an event of market disruption under the Model Code?
A. Concerted central bank intervention.
B. The failure of SWIFT.
C. The imposition of capital controls.
D. A major terrorist attack on a financial centre.
Answer: A

NEW QUESTION: 3 Which statement about an RSPAN session configuration is true?
A. Only one session can be configured at a time.
B. Only incoming traffic can be monitored.
C. A filter must be configured for RSPAN Regions.
D. A special VLAN type must be used as the RSPAN destination.

Answer: D Explanation: The traffic for each RSPAN session is carried over a user-specified RSPAN VLAN that is dedicated for that RSPAN session in all participating switches -> This VLAN can be considered a special VLAN type -> Answer C is correct. Reference: https://www.cisco.com/c/en/us/td/docs/switches/lan/catalyst3750x_3560x/software/release/12-2_55_se/configuration/guide/3750xscg/swspan.html We can configure multiple RSPAN sessions on a switch at a time, then continue configuring multiple RSPAN sessions on the other switch without any problem -> Answer B is not correct. This is how to configure Remote SPAN (RSPAN) feature on two switches. Traffic on FastEthernet0/1 of Switch 1 will be sent to Fa0/10 of Switch2 via VLAN 40.

```
Switch1,2(config)#vlan 40
Switch1,2(config-vlan)#remote-span
Configure on Switch1
Switch1(config)# monitor session 1
source interface FastEthernet 0/1
Switch1(config)# monitor session 1 destination remote vlan 40
Configure on Switch2
Switch2(config)# monitor session 5 source remote vlan 40
Switch2(config)# monitor session 5 destination interface FastEthernet 0/10
```
