NEW QUESTION: 2 You have an Azure Stream Analytics query. The query returns a result set that contains 10,000 distinct values for a column named clusterID. You monitor the Stream Analytics job and discover high latency. You need to reduce the latency. Which two actions should you perform? Each correct answer presents a complete solution. **NOTE:** Each correct selection is worth one point.**A.** Convert the query to a reference query.**B.** Increase the number of streaming units.**C.** Add a temporal analytic function.**D.** Scale out the query by using PARTITION BY.**E.** Add a pass-through query.**Answer: B, D**

The higher the number of SUs, the more CPU and memory resources are allocated for your job. This capacity lets you focus on the query logic and abstracts the need to manage the hardware to run your Stream Analytics job in a timely
