NEW QUESTION: 1 Which three statements about bridge assurance are true? (Choose three.)
A. Bridge assurance is enabled on STP point-to-point links only.
B. Bridge assurance is enabled on STP multipoint links only.
C. Bridge assurance can be enabled on one end of a link or on both ends.
D. If a bridge assurance port fails to receive a BPDU after a timeout, the port is put into a blocking state.
E. If a bridge assurance port fails to receive a BPDU after a timeout, the port is put into an error disabled state.
F. Bridge assurance must be enabled on both ends of a link.

Answer: A, D, F
Explanation: Bridge Assurance is enabled by default and can only be disabled globally. Also, Bridge Assurance can be enabled only on spanning tree network ports that are point-to-point links. Finally, both ends of the link must have Bridge Assurance enabled. With Bridge Assurance enabled, BPDUs are sent out on all operational network ports, including alternate and backup ports, for each hello time period. If the port does not receive a BPDU for a specified period, the port moves into the blocking state and is not used in the root port calculation. Once that port receives a BPDU, it resumes the normal spanning tree transitions.

NEW QUESTION: 2 You perform a security audit on a server named Server1. You install the Microsoft Network Monitor 3.0 application on Server1. You find that only some of the captured frames display host mnemonic names in the Source column and the Destination column. All other frames display IP addresses. You need to display mnemonic host names instead of IP addresses for all the frames. What should you do?
A. Create a new display filter and apply the filter to the capture.
B. Populate the Aliases table and apply the aliases to the capture.
C. Create a new capture filter and apply the filter to the capture.
D. Configure the Network Monitor application to enable the Enable Conversations option. Recapture the data to a new file.

Answer: B
Explanation: Aliases allow you to turn IP addresses into names that make sense in a particular network capture. For example, you could label one machine as 'Server' and another machine as 'Client'.
