NEW QUESTION: 3Which statement about the overload bit in IS-IS is true?**A.** Routers running SPF ignore LSPs with the overload bit set and hence avoid blackholing traffic.**B.** The IS-IS adjacencies on the links for which the overload bit is set are brought down.**C.** The overload bit in IS-IS is used only for external prefixes.**D.** A router setting the overload bit becomes unreachable to all other routers in the IS-IS area.**Answer: A****Explanation:**The OL bit is used to prevent unintentional blackholing of packets in BGP transit networks. Due to the nature of these protocols, IS-IS and OSPF converge must faster than BGP. Thus there is a possibility that while the IGP has converged, IBGP is still learning the routes. In that case if other IBGP routers start sending traffic towards this IBGP router that has not yet completely converged it will start dropping traffic. This is because it isn't yet aware of the complete BGP routes. OL bit comes handy in such situations. When a new IBGP neighbor is added or a router restarts, the ISIS OL bit is set. Since directly connected (including loopbacks) addresses on an "overloaded" router are considered by other routers, IBGP can be brought up and can begin exchanging routes. Other routers will not use this router for transit traffic and will route the packets out through an alternate path. Once BGP has converged, the OL bit is cleared and this router can begin forwarding transit traffic.**Reference.**
