memory-optimized tableIn-Memory OLTP can provide great performance benefits for transaction processing, data ingestion, and transient data scenarios.Box 2: materialized viewTo support efficient querying, a common solution is to generate, in advance, a view that materializes the data in a format suited to the required results set. The Materialized View pattern describes generating prepopulated views of data in environments where the source data isn't in a suitable format for querying, where generating a suitable query is difficult, or where query performance is poor due to the nature of the data or the data store.These materialized views, which only contain data required by a query, allow applications to quickly obtain the information they need. In addition to joining tables or combining data entities, materialized views can include the current values of calculated columns or data items, the results of combining values or executing transformations on the data items, and values specified as part of the query. A materialized view can even be optimized for just a single query. References:<https://docs.microsoft.com/en-us/azure/architecture/patterns/materialized-view>
