NEW QUESTION: 1 A company has received the contract to begin developing a new suite of software tools to replace an aging collaboration solution. The original collaboration solution has been in place for nine years, contains over a million lines of code, and took over two years to develop originally. The SDLC has been broken up into eight primary stages, with each stage requiring an in-depth risk analysis before moving on to the next phase. Which of the following software development methods is MOST applicable?
A. Incremental model
B. Spiral model
C. Agile model
D. Waterfall model
Answer: D

NEW QUESTION: 2 Identify the purpose of using Material Status controls.
A. to select the transactions that are permitted to use the inventory on-hand quantity
B. to permit updates to the Item Master record
C. to prevent unnecessary cycle counting in an inventory organization
D. to define the transactions that are permitted for an inventory organization
Answer: A

NEW QUESTION: 3 You have multiple applications installed on a compute instance and these applications generate a large amount of log files. These log files must reside on the boot volume for a minimum of 15 days and must be retained for at least 60 days. The 60-day retention requirement is causing an issue with available disk space. What are the two recommended methods to provide additional boot volume space for this compute instance?
A. Create a custom image and launch a new compute instance with a larger boot volume size.
B. Terminate the instance while preserving the boot volume. Create a new instance from the boot volume and select a DenseIO shape to take advantage of local NVMe storage.
C. Create an object storage bucket and use a script that runs daily to move log files older than 15 days to the bucket.
D. Write a custom script to remove the log files on a daily basis and free up the space on the boot volume.
E. Create and attach a block volume to the compute instance and copy the log files.
Answer: C,E

NEW QUESTION: 4 You require fault tolerance for your operating system so that your computer

running Windows 7 Home Premium can still boot up if a disk fails. You have two disks and unallocated space on your second disk. What should you do? **A.** Create a RAID-1 volume. **B.** Create a RAID-0 volume. **C.** Create a RAID-5 volume. **D.** Create a VHD and install an image of your computer on the VHD. Use BCDEdit to make the VHD bootable. **Answer: A**

Explanation: Creating a Mirrored Volume (RAID-1) A mirrored or RAID-1 volume provides availability and fault tolerance but does not improve performance. It uses two disks (or two portions on separate disks) that are the same size. Any changes made to the first disk of a mirror set are also made to its mirror disk. If the first disk fails, the mirror is broken and the second disk is used until the first is repaired or replaced. The mirror is then re-created, and the information on the working disk is mirrored on the repaired disk. The disadvantage of RAID-1 is that you need (for example) two 200-GB disks to hold 200 GB of data. The advantage is that you can mirror a system disk containing your operating system. You create a mirrored volume using a very similar procedure to the one that creates a striped volume, except that you right-click the first disk of your mirror and click New Mirrored Volume to start the appropriate wizard. You then select the second disk. The second disk needs to have a portion of unallocated space that is at least as large as the disk you want to mirror. The drive letter for a mirrored volume is the same as the drive letter of the first disk. You can also use the Diskpart tool to create a mirrored volume. At the Diskpart> prompt you first use the select disk command to select the first disk. You then enter a command with the syntax add disk=<n> to specify the mirror disk.
