**NEW QUESTION: 1**You have an Exchange Server 2016 organization. The organization contains 2,000 mailboxes and 100 distribution groups. You create a distribution group named Managers and you add 20 users to the group. You need to ensure that the members of Managers can create new groups and modify the membership of those groups. Which three actions should you perform? Each correct answer presents part of the solution.**A.** Add the MyBaseOptions and MyDistributionGroups management roles to the Managers role assignment policy.**B.** Create a role assignment policy named Managers.**C.** Assign the role assignment policy.**D.** Assign a sharing policy.**E.** Assign an address book policy (ABP).**F.** Add the MyBaseOptions and MyDistributionGroupMembership management roles to the Managers role assignment policy.**G.** Create a new role group named Managers.**Answer: A,B,C**

**NEW QUESTION: 2**To ensure message integrity, confidentiality and non repudiation between two parties, the MOST effective method would be to create a message digest by applying a cryptographic hashing algorithm against:**A.** the entire message, enciphering the message digest using the sender's private key, enciphering the message with a symmetric key and enciphering the key by using the receiver's public key.**B.** the entire message, enciphering the message digest using the sender's private key, enciphering the message with a symmetric key and enciphering both the encrypted message and digest using the receiver's public key.**C.** any part of the message, enciphering the message digest using the sender's private key, enciphering the message with a symmetric key and enciphering the key using the receiver's public key.**D.** the entire message, enciphering the message digest using the sender's private key and enciphering the message using the receiver's public key.**Answer: A**  
Explanation/Reference:Explanation:Applying a cryptographic hashing algorithm against the entire message addresses the message integrity issue. Enciphering the message digest using the sender's private key addresses non repudiation. Encrypting the message with a symmetric key, thereafter allowing the key to be enciphered using the receiver's public key, most efficiently addresses the confidentiality of the message as well as the receiver's non repudiation. The other choices would address only a portion of the requirements.

**NEW QUESTION: 3**You develop a Microsoft SQL Server 2012 database that contains tables named Customers and Orders. The tables are related by a column named CustomerId.
