While the former has traditionally been emphasized, only recently has the latter been given sufficient attention (see Trusted Platform Module - TPM).As discussed earlier, a Trojan-laden computer defeats strong user authentication. But a "company computer", which is typically supported and managed according to corporate security policies, typically deserves more trust than a "non-company computer". A secure SSL VPN infrastructure should allow you to verify a remote host's identity by checking on predefined end device parameters. Examples include registry entries, special files in a specified location, or digital certificates (as a form of device authentication). The host identity information can be used to make your access permission decisions.
