**NEW QUESTION: 1** Which of the following BEST describes a protective countermeasure for SQL injection?  
**A.** Eliminating cross-site scripting vulnerabilities  
**B.** Validating user input in web applications  
**C.** Placing a firewall between the Internet and database servers  
**D.** Installing an IDS to monitor network traffic  
**Answer: B**  
**Explanation:** By validating user input and preventing special characters, we can prevent the injection of client-side scripting code. SQL injection is a code injection technique, used to attack data-driven applications, in which malicious SQL statements are inserted into an entry field for execution (e.g. to dump the database contents to the attacker). SQL injection must exploit a security vulnerability in an application's software, for example, when user input is either incorrectly filtered for string literal escape characters embedded in SQL statements or user input is not strongly typed and unexpectedly executed. SQL injection is mostly known as an attack vector for websites but can be used to attack any type of SQL database.

**NEW QUESTION: 2** Welche der folgenden Optionen verbindet einen PC mit seinem Standard-Gateway?  
**A.** Router  
**B.** NIC  
**C.** Kabelmodem  
**D.** Wechsler  
**Answer: D**

**NEW QUESTION: 3** Which security measures can protect the control plane of a Cisco router? (Choose two.)  
**A.** Port security  
**B.** Access control lists  
**C.** CoPP  
**D.** Parser views  
**E.** CCoPP  
**Answer: C, E**  
**Explanation:** Explanation Three Ways to Secure the Control Plane+ Control plane policing (CoPP): You can configure this as a filter for any traffic destined to an IP address on the router itself.+ Control plane protection (CPPr): This allows for a more detailed classification of traffic (more than CoPP) that is going to use the CPU for handling.+ Routing protocol authentication For example, you could decide and configure the router to believe that SSH is acceptable at 100 packets per second, syslog is acceptable at 200 packets per second, and so on. Traffic that exceeds the thresholds can be safely dropped if it is not from one of your specific management stations. You can specify all those details in the policy. You learn more about control plane security in Chapter 13, "Securing Routing Protocols and the Control Plane." Selective Packet Discard (SPD) provides the ability to Although not necessarily a security feature, prioritize certain types of packets (for example, routing protocol packets and Layer 2 keepalive messages, route processor [RP]). SPD provides priority of critical control plane traffic which are received by the over traffic that is less important or, worse yet, is being sent maliciously to starve the CPU of resources required for the RP.
