this is by far the most cost-effective alternative to expensive training for the SAP Certified Associate - Integration Developer, One-year update freely, This content makes them expert with the help of the SAP Certification C\_CPI\_2404 practice exam.

**NEW QUESTION: 1**You need to configure network connectivity between a virtual network named VNET1 and a virtual network named VNET2. The solution must ensure that virtual machines connected to VNET1 can communicate with virtual machines connected to VNET2.To complete this task, sign in to the Azure portal and modify the Azure resources.**Answer:** Explanation:See the explanation below.ExplanationYou need to configure VNet Peering between the two networks. The questions states, "The solution must ensure that virtual machines connected to VNET1 can communicate with virtual machines connected to VNET2". It doesn't say the VMs on VNET2 should be able to communicate with VMs on VNET1. Therefore, we need to configure the peering to allow just the one-way communication.1. In the Azure portal, type Virtual Networks Virtual Networks from the search results then select VNET1. Alternatively, browse to in the left navigation pane.2. In the properties of VNET1, click on3. In the Peerings blade, click Add4. In the Name of the peering from VNET1 to remote virtual network box, enter a name such as VNET1-VNET2 (this is the name that the peering will be displayed as in VNET1)5. In the Virtual Network box, select6. In the Name of the peering from remote virtual network to VNET1 box, enter a name such as VNET2-VNET1 (this is the name that the peering will be displayed as in VNET2).There is an option Allow virtual network access from VNET to remote virtual network. This should be left as Enabled.7. For the option Allow virtual network access from remote network to VNET1, click the slider button to Disabled.8. Click the OK button to save the changes.Reference:  
<https://docs.microsoft.com/en-us/azure/virtual-network/virtual-network-manage-peering>

**NEW QUESTION: 2**The subscriber-host gets an IP address from the RG. The RG does not manage the state of the IP addresses. Which packet does the RG send to the subscriber-host?**A.** ICMPv6 packet**B.** DHCPv6 packet**C.** SLAAC packet**D.** SNMP packet**Answer: A**

**NEW QUESTION: 3**When a station communicates on the network for the first time, which of the following protocol would search for and find the Internet Protocol (IP) address that matches with a known Ethernet address?**A.** Internet Control Message protocol (ICMP).**B.** User Datagram Protocol (UDP).**C.** Address Resolution Protocol (ARP).**D.** Reverse Address Resolution Protocol (RARP).**Answer: D**Explanation:The RARP protocol sends out a packet, which includes its MAC address and a request to be informed of the IP address that should be assigned to that MAC

address. ARP does the opposite by broadcasting a request to find the Ethernet address that matches a known IP address. ICMP supports packets containing error, control, and informational messages (e.g. PING). UDP runs over IP and is used primarily for broadcasting messages over a network.
