NEW QUESTION: 3 In Ethernet networks, duplex mismatches will lower performance. Which error statistics can be seen if a duplex mismatch is present? **A.** collisions on the full-duplex side; runts on the half-duplex side **B.** collisions on the half-duplex side; giants on the full-duplex side **C.** collisions on the full-duplex side; collisions on the half-duplex side **D.** collisions on the half-duplex side; framing errors on the full-duplex side **Answer: D** Explanation: On an Ethernet connection, a duplex mismatch is a condition where two connected devices operate in different duplex modes, that is, one operates in half duplex while the other one operates in full duplex. This results in the full-duplex side receiving an incomplete frame with CRC error or a runt frame. It does not detect any collision since CSMA/CD is disabled on the full-duplex side. As a result, when both devices are attempting to transmit at (nearly) the same time, the packet sent by the full-duplex end will be discarded and lost due to an assumed collision and the packet sent by the half duplex device will be delayed or lost due to a CRC error in the frame.
