**C.** through R2, because R3 is in a different autonomous system  
**D.** through R2, because it is an intra-area path  
**Answer: D**

**NEW QUESTION: 3** In which of the following web technologies a user's request is fulfilled by running a script directly on the Web server to generate the dynamic web pages?  
**A.** Client-side scripting  
**B.** HTML  
**C.** Server-side scripting  
**D.** VBScript  
**Answer: C**  
**Explanation:** Server-side scripting is a web server technology in which a user's request is fulfilled by running a script directly on the web server to create dynamic web pages. Server-side scripting is in fact the script that runs on a server. When a browser requests an HTML file, the server returns the file, but if the file contains a server-side script, the script inside the HTML file is executed by the server before the file is returned to the browser as plain HTML. PHP, ColdFusion, and ASP are the most commonly used server-side scripts. Answer option C is incorrect. Client-side scripting refers to the scripts that are executed on the Web browser instead of on the Web server. Client-side scripting is used to make a Web page interactive and dynamic. It enables a user to respond to the events fired by him on the objects that he can see on the Web page. The most important part of client-side scripting is form validation, which helps a script writer to create a form and abort the users from entering wrong data. If a user fills in the wrong data in a field, the dialog boxes can warn him for the error and request him to correct it. Answer option D is incorrect. HTML, which stands for Hyper Text Markup Language, is the predominant markup language for Web pages. It provides a means to create structured documents by denoting structural semantics for text such as headings, paragraphs, lists, links, quotes, and other items. It allows images and objects to be embedded and can be used to create interactive forms. It is written in the form of HTML elements consisting of 'tags' surrounded by angle brackets within the web

page content. It can load scripts in languages such as JavaScript which affect the behavior of HTML Web pages. HTML can also be used to include Cascading Style Sheets (CSS) to define the appearance and layout of text and other material. The W3C, maintainer of both HTML and CSS standards, encourages the use of CSS over explicit presentational markup. Answer option A is incorrect. VBScript (Visual Basic Scripting Edition) is an Active Scripting language developed by Microsoft that is modeled on Visual Basic. It is designed as a 'lightweight' language with a fast interpreter for use in a wide variety of Microsoft environments. VBScript uses the Component Object Model to access the elements of the environment within which it is running; for example, the FileSystemObject (FSO) is used to create, read, update, and delete files. A VBScript script must be executed within a host environment, of which there are several provided with Microsoft Windows, including: Windows Script Host (WSH), Internet Explorer (IE), and Internet Information Services (IIS). Additionally, the VBScript hosting environment is embeddable in other programs, through technologies, such as the Microsoft Script Control.
